## 1 Introduction and functional overview

The Cantsyn module handles the distribution of time information over CAN buses.

Just transmitting the time information from the master to the slaves in a broadcast CAN message has the disadvantage that the time value becomes inaccurate due to CAN specific effects like arbitration and BSW specific delays.

The concept proposes a two-step mechanism:

In a first broadcast message (the so-called SYNC message), the second portion
of the time information (t0r) is transmitted. The transmitting ECU, i.e. the Time
Master, uses CAN low-level mechanisms like the "CAN transmit confirmation" to
detect the point in time (t1r) when the message was actually transmitted, i.e. it
takes a timestamp.

A receiving ECU, i.e. the Time Slave, receives the message and uses CAN low-level mechanisms like the "CAN receive indication" to detect the point in time (t2r) when the message was actually received.

- In a second broadcast message (the so-called Follow-Up (FUP) message), the Time Master transmits the offset between the time information transmitted in the previous SYNC message and the actual detected transmission time. No timestamp is taken for the FUP message, neither on the transmitting nor on the receiving side.
- The Time Slave can now combine the information within the SYNC and within the FUP message and with its previously taken timestamp for the received SYNC message and determine the transmitted time information in a more precise way by just receiving one message and omitting timestamps.

Figure 1.1 shows the CAN Time Synchronization mechanism.

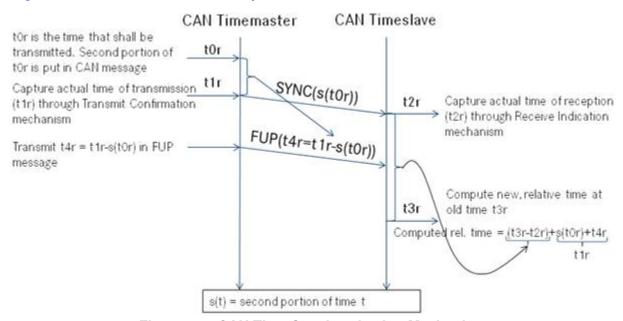

Figure 1.1: CAN Time Synchronization Mechanism

In addition, the CantSyn module supports the distribution of time information over CAN buses with security. The figure below shows the time provider modules interface with the security modules in the AUTOSAR Layered Architecture.

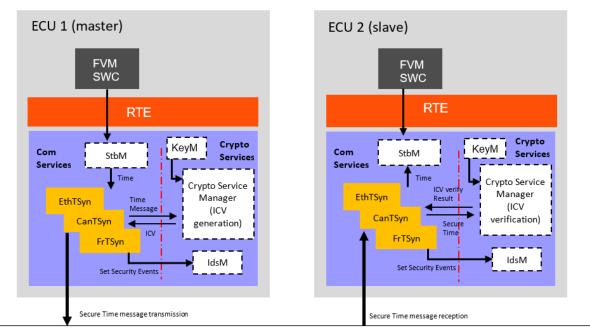

Figure 1.2: Timesync modules interface with security modules in the AUTOSAR Layered Architecture

# **Acronyms and Abbreviations**

This section lists module local abbreviations and definitions. For additional Time Synchronization related abbreviations and definitions refer to chapter 3 in the RS Time Synchronization [1]. For general terms and abbreviations refer to the AUTOSAR Glossary [2].

Abbreviation	Description	
GTM	Global Time Master	
BswM	BSW Mode Manager module	
<bus>TSyn</bus>	Bus specific Time Synchronization module	
CAN FD	Controller Area Network (CAN) - Flexible Data Rate	
CanTSyn	Time Synchronization over CAN module	
CRC	Cyclic Redundancy Checksum	
CSM	Crypto Service Manager	
Debounce Time	Minimum gap between two TX messages with the same PDU	
Det	Default Error Tracer module	
DLC	Data Length Code	
DoS	Denial of Service	
Canlf	CAN interface module	
FUP message	Follow-Up message	
FV	Freshness Value	
FVM Freshness Value Manager		
ICV	Integrity Check Value	
MAC	Message Authentication Code	
OFNS message	Offset adjustment message	
OFS message	Offset Synchronization message	
OVS	Overflow Seconds value (field in FUP message)	
SC	Sequence Counter in Time Synchronization messages	
SGW	"Synchronized to Gateway" state of Time Synchronization	
StbM	Synchronized Time-Base Manager	
SYNC message	Time Synchronization message	
Timesync	Time Synchronization

# 3.2 Related specification

AUTOSAR provides a General Specification on Basic Software modules [3, SWS BSW General], which is also valid for Cantsyn.

Thus, the General Specification on Basic Software (SWS BSW General) shall be considered additionally and as required specification for CantSyn.

# 4 Constraints and assumptions

### 4.1 Limitations

- 1. The Time Base in the SYNC and OFS messages is limited to 32 bit, wherefore the maximum supported time value is 4294967295 seconds (2<sup>32</sup>-1).
- 2. Time Masters, Time Gateways and Time Slaves shall work with a Time Base reference clock with a worst-case accuracy of  $2\mu$ s.
- 3. "CRC secured" in the context of this document refers to CRC integrity protection mechanism and does not imply that CRC is used as a cybersecurity solution.
- 4. The authentication protection mechanism of the time is not supported on classic CAN busses, due to below reasons.
  - The authentication protection mechanism is complex to achieve on classic CAN busses due to payload limitation and any solution incorporated will leave the security vulnerabilities (e.g., cryptographic attacks, DoS).
  - Today's ECUs in vehicle E/E architecture supports both classic CAN and CanFD channels.

## 4.2 Applicability to car domains

Automotive systems requiring a common Time Base for ECUs regardless of which bus system the ECUs are connected to.

# 5 Dependencies to other modules

The Time Synchronization over CAN (CantSyn) has interfaces towards the Synchronized Time-Base Manager (StbM), the CAN Interface (CanIf), the BSW Mode Manager (BswM), the Crypto Service Manager (CSM) and the Default Error Tracer (Det).

# 7 Functional specification

This chapter defines the behavior of the Time Synchronization over CAN. The API of the module is defined in chapter 8, while the configuration is defined in chapter 10.

#### 7.1 Overview

The Time Synchronization over CAN is responsible to realize the CAN specific Time Synchronization protocol.

Time Synchronization principles and common wording is described in the SWS Synchronized Time-Base Manager [5] and RS Time Synchronization [1].

### 7.2 Module Handling

This section contains description of auxiliary functionality of the Time Synchronization over CAN.

[SWS\_CanTSyn\_00135] [If CanTSyn calls an API of the StbM, it shall use the Time Base ID of the Time Base referenced via the parameter CanTSynSynchronized-TimeBaseRef of the corresponding Time Domain. | (RS TS 20032, RS TS 20038)

### 7.2.1 Interrupt Handling

When transmitting or receiving a SYNC message, the current value of the Virtual Local Time needs to be captured in the RX indication / TX confirmation callbacks

- either in interrupt mode in context of the RX / TX interrupt
- or in polling mode in the main function (Note: it is strongly recommended not to use polling mode for Time Slaves).

Any delay between the occurrence of the interrupt itself and the determination of the current Virtual Local Time worsens the precision of either the transmitted or received Time Base.

Therefore, it is inevitable that these RX indication / TX confirmation callbacks establish a protection against interruptions immediately after being called (if called in context of the RX / TX interrupt with interrupt nesting disabled, this is implicitly ensured by the controller).

Thereafter only the necessary checks shall be made to determine that the message is a SYNC message (and to determine the Time Base ID if necessary). Once the Time Base ID and the SYNC message type are confirmed the current value of the Virtual Local Time is obtained from a function call to the StbM (still in the context of locked

interrupts). Afterwards the interruption protection can be removed without having a negative impact on the precision.

As a consequence it might be possible that a snapshot of the Virtual Local Time is taken although the subsequent frame checks (e.g., CRC validation, SC validation) might fail and thus the snapshot becomes superfluous.

#### 7.2.2 Initialization

The Time Synchronization over CAN is initialized via CanTSyn\_Init. Except for CanTSyn\_GetVersionInfo and CanTSyn\_Init, the API functions of the Time Synchronization over CAN may only be called when the module has been properly initialized.

**[SWS\_CanTSyn\_00003]** [A call to CanTSyn\_Init initializes all internal variables and sets the Time Synchronization over CAN to the initialized state.  $|(RS_TS_00003, RS_TS_00004)|$ 

**[SWS\_CanTSyn\_00007]** [The Sequence Counter (SC) shall be initialized with 0.] (RS TS 20033)

#### 7.2.3 Error Handling

[SWS\_CanTSyn\_00088] [On errors and exceptions, the CanTSyn module shall not modify its current module state but shall simply report the error event.] (RS\_TS\_20034, SRS\_BSW\_00323)

## 7.3 Message Format

SYNC, FUP, OFS and OFNS messages are assigned to a dedicated message type "TimeSync".

SYNC, FUP, OFS and OFNS messages of the same Time Domain share the same CAN ID by using a multiplexed signal group. For different Time Domains the same CAN ID may be used if Timesync messages are sent by the same Time Master or Time Gateway. For different Time Domains different CAN IDs shall be used if Timesync messages are sent by different Time Masters or Time Gateways. The multiplexer is located at byte 0, named as  ${\tt Type}$ .

The usage of a CRC is optional. To ensure a great variability between several time observing units, the configuration decides of how to handle CRC secured Timesync messages if the receiver does not support the CRC calculation. Hence it might be possible, that a receiver is just using the given Time Base value without evaluating the CRC.

SYNC, FUP, OFS and OFNS messages can be secured by ICV, that provides the integrity and authenticity protection of these messages. The authentication of time is supported for extended CAN only.

The usage of a ICV is optional. To ensure a great variability between several time observing units, the configuration decides on how to handle ICV protected Time Synchronization messages if the receiver does not support the ICV calculation. Hence it might be possible, that a receiver is just using the given Time Base value without evaluating the ICV.

To ensure the greater performance of the system, the ICV is included only in FUP message. However, the data used for ICV calculation includes the payload of SYNC and FUP messages. Similarly for the offset messages, the ICV is included in extended OFS message.

[SWS\_CanTSyn\_00008] [The byte order for time value signals in Time Synchronization messages is "Big Endian". | (RS TS 20035)

**[SWS\_CanTSyn\_00010]** [For classic CAN the DLC of SYNC, FUP, OFS and OFNS messages shall be 8.

For CAN FD, if

- CanTSynUseExtendedMsgFormat is TRUE
- and if CantsynGlobalTimeTxIcvSecured is ICV\_NOT\_SUPPORTED and CantsynRxIcvVerificationType is ICV\_NOT\_SUPPORTED,

the DLC of SYNC, FUP, OFS and OFNS messages shall be 16.

For CAN FD, if

- CanTSynUseExtendedMsgFormat is TRUE
- and if CantsynGlobalTimeTxIcvSecured is ICV\_SUPPORTED or Cantsyn-RxIcvVerificationType is ICV\_SUPPORTED,

the DLC of SYNC, FUP, OFS and OFNS messages shall be variable up to 64.  $(RS_-TS 20035, RS TS 20068, RS TS 20073)$ 

[SWS\_CanTSyn\_00011] [Depending on its type Time Synchronization messages may contain User Data according to the given message format. | (RS\_TS\_20035, RS\_TS\_20037)

[SWS\_CanTSyn\_00012] [User Data shall be read consistently from incoming Time Synchronization messages that contain User Data Fields.] (RS TS 20037)

**[SWS\_CanTSyn\_00013]** [User Data shall be written consistently to outgoing Time Synchronization messages that contain User Data Fields.

If the number of User Data Fields in a Time Synchronization message is greater than the number of User Data Bytes provided by the StbM, the remaining User Data Fields shall be set to 0 (default value). | (RS TS 20037)

[SWS\_CanTSyn\_00014] [User Data shall be mapped to the StbM\_UserDataType, where the byte number given in the message and by the StbM\_UserDataType shall match (User Byte 0 mapped to StbM\_UserDataType.userByte0, etc.).

StbM\_UserDataType.userDataLength shall be set to the Time Synchronization message type specific number of User Bytes.|(RS TS 20037)

#### 7.3.2 Offset Messages

Offset messages can be multiplexed with the Time Synchronization messages (using the same PDU, etc.).

For Classic CAN (CAN 2.0) two different Offset messages are used, OFS and OFNS. For both of them there are variants with and without a CRC field.

For CAN FD, if CanTSynUseExtendedMsgFormat is TRUE, the content of OFS and OFNS is merged into a single Extended OFS message (variants with and without a CRC field exist as well). Also, there are variants with and without a ICV field.

[SWS\_CanTSyn\_00132] [CanTSynUseExtendedMsgFormat shall always be FALSE for CAN 2.0 buses.|(RS TS 20068)

[SWS\_CanTSyn\_00130] [If CanTSynUseExtendedMsgFormat is FALSE, then the Normal Offset Message Format shall be used, i.e., Offset Messages with message Type 0x34, 0x44, 0x3C and 0x4C. ](RS\_TS\_20068)

Note: For Normal Offset Message Format refer to chapter 7.3.2.1

[SWS\_CanTSyn\_00131] [If CanTSynUseExtendedMsgFormat is TRUE, then the Extended Offset Message Format shall be used, i.e., Offset Messages with message

Type 0x54, 0x64, 0x94 and 0xA4. ](RS\_TS\_20068)

Note: For Extended Offset Message Format refer to chapter 7.3.2.2

### 7.3.2.1 Normal Offset Messages

# 7.4 Acting as Time Master

A Time Master is an entity which is the master for a certain Time Base and which propagates this Time Base to a set of Time Slaves within a certain segment of a communication network, being a source for this Time Base.

If a Time Master is also the owner of the Global Time Base, the Time Base from which all further Time Bases are derived from, then it is the Global Time Master (refer to Figure 7.1). A Time Gateway typically consists of one Time Master port which is connected to one or more Time Slaves. When mapping time entities to real ECUs it has to be noted, that an ECU could be Time Master (or even Global Time Master) for one Time Base and Time Slave for another Time Base.

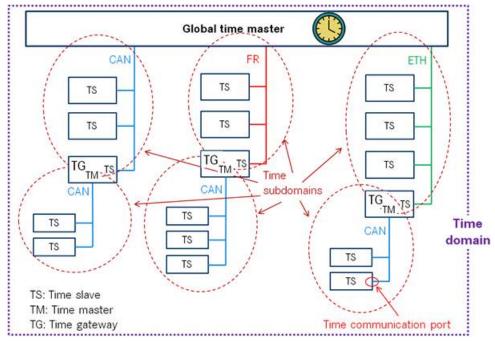

Figure 7.1: Terminology Example

[SWS\_CanTSyn\_00136] [A master shall transmit SYNC, FUP, OFS and OFNS messages by calling CanIf\_Transmit with the Pduld derived via CanTSynGlobal-TimePduRef of the corresponding Time Domain. | (RS\_TS\_20031)

#### 7.4.1 SYNC and FUP message processing

**[SWS\_CanTSyn\_00025]** A Time Master shall start each Time Synchronization sequence for a Synchronized Time Base with a SYNC message. **[RS\_TS\_20031, RS\_TS\_20035]** 

**[SWS\_CanTSyn\_00026]** [A Time Master shall finish each Time Synchronization sequence for a Synchronized Time Base with a FUP message. | (RS TS 20031, RS TS 20035)

**[SWS\_CanTSyn\_00027]** [If a transmission of a SYNC or FUP message fails (  $CanTSyn_TxConfirmation$  is called with  $E_NOT_OK$ ), CanTSyn shall reset the state machine to start with a new SYNC transmission again once it is due.] (RS\_TS\_20034, RS\_TS\_20035)

Note: No FUP message will be sent, if the SYNC message transmission fails.

[SWS\_CanTSyn\_00028] [If configured as Time Master of a Synchronized Time Domain (refer to CanTSynGlobalTimeDomain) the CanTSyn module shall periodically transmit SYNC messages with the cycle CanTSynGlobalTimeTxPeriod if

- the GLOBAL\_TIME\_BASE bit within the timeBaseStatus is set
- and CantSynGlobalTimeTxPeriod is unequal to 0

• and if the associated cyclicMsqResumeCounter is not running.

The cyclic transmission shall be started in the earliest possible CantSyn\_MainFunction call once the requirements above are fulfilled. | (RS\_TS\_20031, RS\_TS\_20035)

**Note:** "earliest possible" means:

- In the next Cantsyn\_MainFunction, because GLOBAL\_TIME\_BASE is set outside the Cantsyn MainFunction.
- In the current CanTSyn\_MainFunction, when switching from immediate to cyclic transmission (because this decision is made inside the CanTSyn\_MainFunction).

**[SWS\_CanTSyn\_00029]** [The SYNC and FUP sequence shall not be interrupted, neither by Time Synchronization messages of the same Time Domain nor by Time Synchronization messages of other Time Domains if the same CAN ID is used for the Time Synchronization messages.] (RS TS 20035)

[SWS\_CanTSyn\_00031] [If the CanTSynGlobalTimeTxIcvSecured is CRC\_-NOT\_SUPPORTED, then depending on CanTSynGlobalTimeTxCrcSecured the SYNC / FUP message shall be of type:

CanTSynGlobalTimeTxCrcSecured <b>Value</b>	SYNC Message Type	FUP Message Type
CRC NOT SUPPORTED	0x10	0x18
CKC_NOT_SOLI OKTED	SYNC not CRC	FUP not CRC
	secured message	secured message
CDC CUDDODTED	0x20	0x28
CRC_SUPPORTED	SYNC CRC	FUP CRC
	secured message	secured message

Table 7.15: Settings of CanTSynGlobalTimeTxCrcSecured for SYNC / FUP messages without ICV

(RS TS 20033, RS TS 20035)

[SWS\_CanTSyn\_00159]{DRAFT} [If the CanTSynGlobalTimeTxIcvSecured is CRC\_SUPPORTED and CanTSynUseExtendedMsgFormat is TRUE, then depending on CanTSynGlobalTimeTxCrcSecured the SYNC / FUP message shall be of type:

CanTSynGlobalTimeTxCrcSecured Value	SYNC Message Type	FUP Message Type
CRC NOT SUPPORTED	0x10	0x78
CRC_NOI_SUPPORTED	SYNC not CRC	FUP not CRC, ICV
	authenticated message	authenticated message
CRC SUPPORTED	0x20	0x88
CRC_SUPPORTED	SYNC CRC	FUP CRC, ICV
	authenticated message	authenticated message

Table 7.16: Settings of CanTSynGlobalTimeTxCrcSecured for SYNC / FUP messages with ICV

(RS TS 20073)

**[SWS\_CanTSyn\_00032]** [A transmitter of FUP messages (Time Master) is using as trigger condition for SYNC to FUP that the debounceCounter value reaches 0.] (RS\_-TS\_20031, RS\_TS\_20035)

**Note:** Refer to chapter 7.4.4 for the use of the debounceCounter.

**[SWS\_CanTSyn\_00033]** [Each transmission request of a SYNC message shall be monitored for a transmit confirmation timeout.

If  ${\tt CanTSyn\_TxConfirmation}$  is not called within 3 sec after transmission request,  ${\tt CanTSyn}$  shall

- wait until CantSyn\_TxConfirmation is called (with E\_OK or E\_NOT\_OK) and
- send no FUP message and
- instead reset the state machine to start with a new SYNC transmission once it is due.

(RS TS 20034, RS TS 20035)

**Note:** A timeout of 3 sec is used to avoid an overflow of the SyncTimeNSec value in the FUP message (value range: 0 .. 2<sup>32</sup> - 1 ns), if CanTSyn\_TxConfirmation is called late

## 7.4.2 OFS message processing

[SWS\_CanTSyn\_00035] A Time Master shall start each Time Synchronization sequence for an Offset Time Base with an OFS message. | (RS\_TS\_20031, RS\_TS\_20036)

[SWS\_CanTSyn\_00036] [If CanTSynUseExtendedMsgFormat is FALSE, a Time Master shall finish each Time Synchronization sequence for an Offset Time Base with an OFNS message. | (RS\_TS\_20031, RS\_TS\_20036, RS\_TS\_20068)

**Note:** If CanTSynUseExtendedMsgFormat is TRUE, OFNS messages are not required.

**[SWS\_CanTSyn\_00037]** [If the transmission of an OFS or an OFNS message fails (i.e., CanTSyn\_TxConfirmation for the corresponding PDU is called with parameter result set to  $E_NOT_OK$ ), the state machine shall be reset to start with a new OFS transmission again (once it is due).] (RS\_TS\_20034, RS\_TS\_20036)

Note: No OFNS message will be sent, if the OFS message transmission fails

[SWS\_CanTSyn\_00038] [If configured as Time Master of an Offset Time Domain (refer to CanTSynGlobalTimeDomain) the CanTSyn module shall periodically transmit OFS messages with the cycle CanTSynGlobalTimeTxPeriod if

• the GLOBAL\_TIME\_BASE bit within the timeBaseStatus of the referenced Time Base CantSynSynchronizedTimeBaseRef is set

- and CantSynGlobalTimeTxPeriod is unequal to 0
- and if the associated cyclicMsgResumeCounter is not running.

The cyclic transmission shall be started in the earliest possible CantSyn\_MainFunction call once the requirements above are fulfilled. | (RS TS 20031, RS TS 20036)

**Note:** "earliest possible" means:

- In the next CantSyn\_MainFunction, because GLOBAL\_TIME\_BASE is set outside the CantSyn MainFunction.
- In the current CanTSyn\_MainFunction, when switching from immediate to cyclic transmission (because this decision is made inside the CanTSyn\_Main-Function).

**[SWS\_CanTSyn\_00039]** [The OFS and OFNS sequence shall not be interrupted, neither by Time Synchronization messages of the same Time Domain nor by Time Synchronization messages of other Time Domains if the same CAN ID is used for the Time Synchronization messages.] (RS\_TS\_20036)

[SWS\_CanTSyn\_00040] [A transmitter of OFNS messages (Time Master) is using as trigger condition for OFS to OFNS that the debounceCounter value reaches 0.] (RS\_TS\_20036)

**Note:** Refer to chapter 7.4.4 for the use of the debounceCounter.

[SWS\_CanTSyn\_00041] [If the CanTSynGlobalTimeTxIcvSecured is CRC\_-NOT\_SUPPORTED, then depending on CanTSynGlobalTimeTxCrcSecured the OFS / OFNS message shall be of type:

Bus Type	Value of Parameter	OFS Message Type	OFNS Message Type
	CanTSynGlobalTimeTxCrcSecured		
CAN	CRC_NOT_SUPPORTED	0x34	0x3C
		OFS not CRC	OFNS not CRC
		secured message	secured message
	CRC_SUPPORTED	0x44	0x4C
		OFS CRC	OFNS CRC
		secured message	secured message
CAN FD	CRC_NOT_SUPPORTED	0x54	Not Available
(CanTSyn-		OFS not CRC	
UseExtended-		secured message	
MsgFormat	CRC_SUPPORTED	0x64	
= TRUE)		OFS CRC	
		secured message	

Table 7.17: Settings of CanTSynGlobalTimeTxCrcSecured for OFS / OFNS messages without ICV

(RS TS 20033, RS TS 20036, RS TS 20068)

[SWS\_CanTSyn\_00160]{DRAFT} [If CanTSynGlobalTimeTxIcvSecured is CRC\_SUPPORTED and CanTSynUseExtendedMsgFormat is TRUE, then depending

on  ${\tt CanTSynGlobalTimeTxCrcSecured}$  the extended OFS message shall be of type:

CanTSynGlobalTimeTxCrcSecured Value	OFS Message Type
CRC NOT SUPPORTED	0x94
CRC_NOI_SUPPORTED	Ext OFS not CRC
	authenticated message
CRC SUPPORTED	0xA4
CRC_SUPPORTED	Ext OFS CRC
	authenticated message

Table 7.18: Settings of CanTSynGlobalTimeTxCrcSecured for Extended OFS messages with ICV

(RS TS 20073)

**[SWS\_CanTSyn\_00042]** [Each transmission request of an OFS message shall be monitored for a transmit confirmation timeout.

If  ${\tt CanTSyn\_TxConfirmation}$  is not called within 3 sec after transmission request,  ${\tt CanTSyn}$  shall

- wait until CantSyn\_TxConfirmation is called (with E\_OK or E\_NOT\_OK) and
- send no OFNS message and
- instead reset the state machine to start with a new OFS transmission once it is due.

(RS TS 20034, RS TS 20036)

**Note:** A reset of the state machine in the event of a timeout avoids, that a possibly outdated Offset Time is sent. Instead the latest Offset Time via StbM\_GetOffset is retrieved.

#### 7.4.3 Transmission mode

[SWS\_CanTSyn\_00043] [If CanTSyn\_SetTransmissionMode (Controller, Mode) is called and parameter Mode equals CANTSYN\_TX\_OFF, all transmit requests from CanTSyn shall be omitted on this CAN channel.] (RS\_TS\_20031, RS\_TS\_20035, RS\_TS\_20036)

[SWS\_CanTSyn\_00044] [If CanTSyn\_SetTransmissionMode (Controller, Mode) is called and parameter Mode equals CANTSYN\_TX\_ON, all transmit requests from CanTSyn on this CAN channel shall be able to be transmitted.] (RS\_TS\_20031, RS\_TS\_20035, RS\_TS\_20036)

#### 7.4.4 Debounce Time

The debounce time shall inhibit transmission bursts of a specific CAN PDU. Inhibiting transmission bursts of Timesync messages on a specific CAN bus is not possible if multiple PDUs are used for multiple Time Domains since there is no inter-PDU debounce time configurable within the Cantsyn module.

[SWS\_CanTSyn\_00123] [If CanTSynGlobalTimeDebounceTime is greater than 0 for a Time Base, CanTSyn shall always do debouncing for the corresponding Timesync PDUs as described below, otherwise CanTSyn shall not do any debouncing. | (RS TS 20031)

[SWS\_CanTSyn\_00124] [CanTSynGlobalTimeDebounceTime represents the debounce value of a PDU specific debounceCounter that shall be started after the Timesync PDU has been successfully sent (i.e., CanTSyn\_TxConfirmation for the corresponding PDU is called with parameter result set to E\_OK).

CanTSyn shall decrement the debounceCounter value on each invocation of CanTSyn\_MainFunction (RS\_TS\_20031)

[SWS\_CanTSyn\_00125] [A new Timesync PDU shall only be sent if the corresponding debounceCounter has a value equal or less than 0.|(RS\_TS\_20031)

**Note:** Since the decrement of the debounceCounter takes place in the CanTSyn\_-MainFunction call but the start of the counter takes place when the Timesync PDU has been sent (either in the subsequent CanTSyn\_MainFunction call or in the transmit confirmation callback function) the effective debounce time will be equal or larger than CanTSynGlobalTimeDebounceTime. The extension of the debounce time shall be limited to the value of CanTSynMainFunctionPeriod

### 7.4.5 Immediate Time Synchronization

In addition to the cyclic Timesync message transmission, an immediate message transmission might be required.

Depending on configuration, the Cantsyn module checks on each Cantsyn\_Main-Function call the necessity for a Timesync message transmission for each Time Base, where a Master Port belongs to.

[SWS\_CanTSyn\_00117] [If CanTSynImmediateTimeSync is set to TRUE for a Time Base, CanTSyn shall check on each CanTSyn\_MainFunction call by calling StbM\_GetTimeBaseUpdateCounter, if the timeBaseUpdateCounter of the corresponding Time Base has changed.] ( $RS_TS_20031$ )

### [SWS CanTSyn 00118] [If

- CanTSynImmediateTimeSync is set to TRUE and
- the timeBaseUpdateCounter of a Time Base has changed and

- the GLOBAL\_TIME\_BASE bit of the timeBaseStatus is set and
- the debounceCounter is 0 and
- no transmission of the corresponding PDU is pending (CanTSyn\_TxConfirmation has been called with E\_OK or E\_NOT\_OK),

CanTSyn shall trigger an immediate transmission of Time Synchronization messages for the corresponding Time Base. | (RS TS 20031)

**Note:** timeBaseStatus can be obtained by StbM\_GetTimeBaseStatus or StbM GetCurrentTime.

[SWS\_CanTSyn\_00119] [If CanTSynImmediateTimeSync is set to TRUE, cyclic MsgResumeCounter and CanTSynCyclicMsgResumeTime shall be considered.] (RS TS 20031)

[SWS\_CanTSyn\_00120] [CanTSynCyclicMsgResumeTime represents the timeout value of a cyclicMsgResumeCounter that shall be started after an immediate transmission of a SYNC or an OFS message has been successfully completed (i.e., CanTSyn\_TxConfirmation for the corresponding PDU is called with parameter result set to E OK), asynchronously to the cyclic Timesync message transmission.

cyclicMsgResumeCounter shall be decremented on each invocation of CanTSyn\_-MainFunction, if no Timesync PDU is transmitted asynchronously. | (RS\_TS\_20031)

[SWS\_CanTSyn\_00121] [If the cyclicMsgResumeCounter has reached a value equal or less than zero, CanTSyn shall resume cyclic Timesync message transmission by sending either a SYNC or OFS message. | (RS TS 20031)

[SWS\_CanTSyn\_00122] [If the cyclicMsgResumeCounter is started CanTSyn shall stop cyclic Timesync message transmission.] (RS\_TS\_20031)

### 7.4.6 Calculation and Assembling of Time Synchronization Messages

This chapter describes the workflow, how the items of a Time Synchronization message will be calculated (1<sup>st</sup> step) and how the message will be assembled (2<sup>nd</sup> step).

#### 7.4.6.1 Global Time Calculation

In addition to the message fields (refer to chapter 7.3)

- SyncTimeSec
- ovs and
- SyncTimeNSec,

which are actually transmitted on the bus by the Time Master, this chapter defines and uses the following internal variables for calculation of the Global Time to be transmitted on the bus for Synchronized Time Domains:

- T0<sub>SYNC</sub>: Global Time retrieved from StbM
- T0<sub>SYNC ns</sub>: Nanosecond part of T0<sub>SYNC</sub>
- T0<sub>VLT</sub>: Virtual Local Time that corresponds to T0<sub>SYNC</sub>. Retrieved together with T0<sub>SYNC</sub> from StbM
- T1<sub>VLT</sub>: Egress timestamp of SYNC message relative to Virtual Local Time in St.bM
- T1<sub>CAN</sub>: Egress timestamp of SYNC message as captured by CAN controller HW
- T4: Correction value for T0<sub>SYNC</sub>, which accounts for the delay between retrieving the time tuple [T0<sub>SYNC</sub>;T0<sub>VLT</sub>] from StbM and actually transmitting the SYNC message on the bus.
- T<sub>currentTime\_CAN</sub>: Current local time as read from CAN controller HW when TX confirmation interrupt for SYNC message is processed in CanTSyn

Refer to Figure 1.1 and to sequence diagram Figure 9.2 for a better understanding of all steps of the Global Time Calculation sequence of the Time Master as specified in the requirements below.

**[SWS\_CanTSyn\_00149]**{DRAFT} If for a Synchronized Time Domain a cyclic or immediate transmission of a SYNC message is requested, the Time Master shall

- 1. get current Synchronized Time Base's Time Tuple as [T0<sub>SYNC</sub>;T0<sub>VLT</sub>] via StbM\_-GetCurrentTime and
- 2. call CanIf\_Transmit with the seconds portion of T0<sub>SYNC</sub> written to Sync-TimeSec field of the message data.

#### (RS TS 20035)

After a successful transmission of the SYNC message the Cantsyn captures the egress timestamp of the SYNC message.

[SWS\_CanTSyn\_00150]{DRAFT} [Upon successful SYNC message TX confirmation for a Synchronized Time Domain and if no TX confirmation timeout has occurred (refer to [SWS\_CanTSyn\_00033]) the Time Master shall within the TX confirmation routine (CanTSyn\_TxConfirmation)

- if HW timestamping is enabled,
  - Retrieve T1<sub>CAN</sub> as egress timestamp from CAN controller HW value via CanIf\_GetEgressTimestamp
- else

 Retrieve T1<sub>VLT</sub> as egress timestamp by reading current Virtual Local Time value via StbM\_GetCurrentVirtualLocalTime

(RS\_TS\_20035, RS\_TS\_20070)

**Note:** If SW timestamping is used, SW should immediately establish a protection against interruptions in the TX confirmation callback - unless interrupt nesting is disabled (when this is typically done implicitly by the controller). Any delay of StbM\_-GetCurrentVirtualLocalTime would impair precision.

Based on the egress timestamps  $T1_{CAN}$  and  $T1_{VLT}$ , respectively, CanTSyn can calculate the delay between reading the tuple  $[T0_{SYNC}; T0_{VLT}]$  from StbM via StbM\_GetCurrentTime and actual transmission of  $T0_{SYNC}$  in the SYNC message on the bus.

T4, which accounts for that delay, is calculated in 3 different ways depending on

- whether HW timestamping is enabled or not and
- whether the StbM is using for internal time measurement the same time source as the CantSyn for Virtual Local Time

This can be done either in the TX confirmation routine (CantSyn\_TxConfirmation) or in the subsequent CantSyn\_MainFunction invocation.

```
 \hspace{-0.1cm} \textbf{[SWS\_CanTSyn\_00151]} \{ \text{DRAFT} \} \hspace{0.1cm} \lceil \hspace{0.1cm} \\ \hspace{0.1cm} \text{If} \hspace{0.1cm} \\ \hspace{0.1cm} \text{III} \hspace{0.1cm} \\ \hspace{0.1cm} \hspace{0.1cm} \\ \hspace{0.1cm} \text{IIII} \hspace{0.1cm} \\ \hspace{0.1cm} \text{IIII} \hspace{0.1cm} \\ \hspace{0.1cm} \text{IIII} \hspace{0.1cm} \\ \hspace{0.1cm} \hspace{0.
```

• HW timestamping is disabled,

CanTSyn shall after successful capture of the egress timestamp (refer to [SWS\_CanTSyn\_00150]):

• calculate T4 =  $T0_{SYNC ns}$  +  $(T1_{VLT}$  -  $T0_{VLT})$ 

(RS\_TS\_20035)

```
\hbox{[SWS\_CanTSyn\_00152]} \{ \hbox{DRAFT} \} \ \lceil
```

- HW timestamping is enabled and
- CanTSyn is using for internal time measurement the same time source as the StbM for Virtual Local Time.

CanTSyn shall after successful capture of the egress timestamp (refer to [SWS\_CanTSyn\_00150])

 calculate T4 = T0<sub>SYNC\_ns</sub> + T1<sub>VLT</sub> - T0<sub>VLT</sub>, with T1<sub>VLT</sub> = T1<sub>CAN</sub>

\((RS TS 20035, RS\_TS\_20070)\)

**Note:** In case CanTSyn uses for internal time measurement the same time source as the StbM for Virtual Local Time T1<sub>CAN</sub> equals T1<sub>VLT</sub>.

# [SWS\_CanTSyn\_00153]{DRAFT} |

- HW timestamping is enabled and
- CanTSyn is using for internal time measurement a different time source as the StbM for Virtual Local Time,

CanTSyn shall after successful capture of the egress timestamp (refer to [SWS CanTSyn 00150]):

- 1. establish a protection against interruptions
- 2. read T<sub>currentTime CAN</sub> via CanIf\_GetCurrentTime,
- 3. read T1<sub>VLT</sub> via StbM\_GetCurrentVirtualLocalTime,
- 4. release the protection against interruptions and
- 5. calculate  $T4 = T0_{SYNC\_ns} + (T1_{VLT} T0_{VLT}) (T_{currentTime\_CAN} T1_{CAN})$

```
|(RS_TS_20035, RS_TS_20070)
```

**Note:** In the above sequence protection against interruptions is important, because any interruption of the sequence of step 2 and step 3 would worsen the precision of T4 and hence the Global Time.

**Note:** The term  $T_{currentTime\_CAN}$  -  $T1_{CAN}$  compensates the interrupt delay from egress timestamping in HW until  $T1_{VLT}$  can be sampled in  $CanTSyn\_TxConfirmation$  via  $StbM\_GetCurrentVirtualLocalTime$ .

[SWS\_CanTSyn\_00154]{DRAFT} [If for a Synchronized Time Domain a FUP message is due, the Time Master shall

- 1. call CanIf Transmit and
- 2. write the following data to the message:
  - (a) seconds portion of T4 (T4 >= 1s) to the OVS field and
  - (b) nanoseconds portion of T4 to the SyncTimeNSec field

(RS TS 20035)

**[SWS\_CanTSyn\_00046]** [The transmitter of an Offset Time Base (Time Master) shall perform the following steps to distribute the Offset Time Base exactly:

- Retrieve current Offset Time via StbM\_GetOffset
- Write seconds portion of the Offset Time to the OfsTimeSec field
- Write nanoseconds portion of the Offset Time to the OfsTimeNSec field

(RS TS 20036)

**Note:** OFS and OFNS messages are not time stamped.

#### 7.4.6.2 OVS Calculation

[SWS\_CanTSyn\_00047] [OVS shall be set within FUP messages if the transmitter detects a nanosecond overflow greater than the defined range of StbM\_TimeStamp-Type.nanoseconds (refer to [SWS\_CanTSyn\_00154]). The leftover part of seconds which does not fit into StbM\_TimeStampType.nanoseconds shall be written to OVS.] (RS\_TS\_20035)

#### 7.4.6.3 SGW Calculation

[SWS\_CanTSyn\_00030] [The SGW value (Time Gateway synchronization status) shall be retrieved from the Time Base synchronization status. If the SYNC\_TO\_GATEWAY bit within timeBaseStatus is not set the SGW value shall be SyncToGTM. Otherwise the SGW value shall be set to SyncToSubDomain. | (RS\_TS\_20035, RS\_TS\_20036)

#### 7.4.6.4 Sequence Counter Calculation

**[SWS\_CanTSyn\_00048]** [A Sequence Counter (SC) of 4 bit is representing numbers from 0 to 15 per Time Domain. The Sequence Counter shall be independent between SYNC and OFS messages and shall be incremented by 1 continuously on every transmission request of a SYNC or OFS message. It shall wrap around at 15 to 0 again.] (RS TS 20033, RS TS 20035, RS TS 20036)

**[SWS\_CanTSyn\_00049]** [The Sequence Counter (SC) value for a FUP message shall be set to the SC value of the corresponding SYNC message. The SC value for an OFNS message shall be set to the SC value of the corresponding OFS message.] (RS TS 20033, RS TS 20035, RS TS 20036)

#### 7.4.6.5 CRC Calculation

[SWS\_CanTSyn\_00050] [The function Crc\_CalculateCRC8H2F as defined in [6] shall be used to calculate the CRC if configured.

|(RS\_TS\_20033, RS\_TS\_20035, RS\_TS\_20036)|

[SWS\_CanTSyn\_00054] [The DataID shall be calculated as DataID = DataIDList [SC], where DataIDList is given by configuration for each message type (refer to configuration containers CanTSynGlobalTimeSyncDataIDList, CanTSynGlobalTimeFupDataIDList, CanTSynGlobalTimeOfsDataIDList and CanTSynGlobalTimeOfnsDataIDList). | (RS TS 20033, RS TS 20035, RS TS 20036)

**Note:** A specific <code>DataID</code> out of a predefined <code>DataIDList</code> ensures the identification of data elements of Time Synchronization messages.

[SWS\_CanTSyn\_00055] [If CanTSynUseExtendedMsgFormat is FALSE, the CRC shall be calculated over Time Synchronization message byte 2 to byte 7 and DataID, where byte 2 is applied first, followed by the other bytes in ascending order, and Data ID last.

If CanTSynUseExtendedMsgFormat is TRUE, the CRC shall be calculated over Time Synchronization message byte 2 to byte 15 and DataID for Extended Timesync message formats, where byte 2 is applied first, followed by the other bytes in ascending order, and DataID last.

(RS TS 20033, RS TS 20035, RS TS 20036, RS TS 20068)

#### 7.4.6.6 ICV Generation

[SWS\_CanTSyn\_00161]{DRAFT} [The ICV shall be calculated over SYNC payload, FUP payload and FV (based on configuration CanTSynIcvGenerationFvIdRef) and is included in the FUP message. | (RS TS 20073)

[SWS\_CanTSyn\_00162]{DRAFT} [The ICV shall be calculated over Extended OFS payload and FV (based on configuration CanTSynIcvGenerationFvIdRef) and is included in the Extended OFS message. | (RS TS 20073)

Refer to the chapter 7.3.13 in StbM [5] for the configuration details of FV referenced in each Time Domain.

[SWS\_CanTSyn\_00163]{DRAFT} [When the FV is referenced (refer CanTSynIcv-GenerationFvIdRef) and the configured truncated FV length (StbMFreshness-ValueTruncLength) == FV length (StbMFreshnessValueLength) in StbM, the Time Master shall call the StbM\_GetTxFreshness Api to obtain the FV by using the StbMFreshnessValueId. |(RS TS 20073)|

[SWS\_CanTSyn\_00164]{DRAFT} [When the FV is referenced (refer CanTSynIcv-GenerationFvIdRef) and the configured truncated FV length (StbMFreshness-ValueTruncLength) < FV length (StbMFreshnessValueLength), the Time Master shall call the StbM\_GetTxFreshnessTruncData Api to obtain the FV and the truncated FV by using the StbMFreshnessValueId. | (RS TS 20073)

[SWS\_CanTSyn\_00165]{DRAFT} [When the FV is not referenced (refer CanTSyn-IcvGenerationFvIdRef), the Time Master shall not include the FV in the ICV generation and fill 0 for FVL field in message types 0x78, 0x88, 0x94, 0xA4.](RS\_-TS 20073)

[SWS\_CanTSyn\_00166]{DRAFT} [If StbM\_GetTxFreshness returns E\_OK, the Time Master shall construct the message types 0x78, 0x88, 0x94, 0xA4 with the full FV, set the FVL to StbMFreshnessValueLength and use the full FV in ICV generation.] (RS\_TS\_20073)

[SWS\_CanTSyn\_00167]{DRAFT} [If StbM\_GetTxFreshnessTruncData returns E\_OK, the Time Master shall construct the message types 0x78, 0x88, 0x94,

 $0 \times A4$  with truncated FV, set the FVL to StbMFreshnessValueTruncLength and use the full FV in ICV generation. | (RS\_TS\_20073)

[SWS\_CanTSyn\_00168]{DRAFT} [If StbM\_GetTxFreshness or StbM\_Get-TxFreshnessTruncData returns E\_NOT\_OK, the Time Master shall:

- stop the ICV generation and accordingly fill 0 for FVL and ICVL fields in message types 0x78, 0x88, 0x94, 0xA4,
- call Det\_ReportRuntimeError with the parameter Errorld set to CANTSYN\_ E FRESHNESSFAILURE (refer [SWS CanTSyn 91001]),
- call IdsM\_SetSecurityEventWithContextData with the parameter EventId set to CANTSYN\_SEV\_FRESHNESS\_NOT\_AVAILABLE (refer [SWS\_CanTSyn\_00204])

(RS TS 20073)

Refer to the chapter 10.2.5 in [7] for the configuration details of CSM job used for ICV generation.

[SWS\_CanTSyn\_00169]{DRAFT} [If CanTSynIcvGenerationBase for the Time Domain is configured to ICV\_MAC, the Time Master shall call Csm\_MacGenerate to generate the ICV value.] (RS\_TS\_20073)

[SWS\_CanTSyn\_00170]{DRAFT} [If CanTSynIcvGenerationBase for the Time Domain is configured to ICV\_SIGNATURE, the Time Master shall call Csm\_SignatureGenerate to generate the ICV value. | (RS\_TS\_20073)

Note: The mode parameter is intentionally left open for the implementer to choose ( i.e. CRYPTO\_OPERATIONMODE\_SINGLECALL would possibly be the best option since it does not require further calls to CSM).

The CSM job used to generate the ICV can be configured to synchronous or asynchronous behaviour.

[SWS\_CanTSyn\_00171]{DRAFT} [If the CSM job used to generate ICV is configured in synchronous behaviour, the Time Master shall disable ICV generation timeout monitoring. | (RS TS 20073)

[SWS\_CanTSyn\_00172]{DRAFT} [If the CanTSynIcvGenerationTimeout is set to 0, the Time Master shall not do the ICV generation timeout monitoring.] (RS\_TS\_-20073)

[SWS\_CanTSyn\_00173]{DRAFT} [If CanTSynIcvGenerationTimeout is set to any value > 0 and Csm\_MacGenerate or Csm\_SignatureGenerate returns E\_OK, the Time Master shall start the CanTSynIcvGenerationTimeout.] (RS TS 20073)

[SWS\_CanTSyn\_00174]{DRAFT} [If CanTSynIcvGenerationTimeout is set to any value > 0 and the CanTSyn\_IcvGenerationIndication callback is called, the Time Master shall stop the running CanTSynIcvGenerationTimeout.] (RS\_TS\_-20073)

[SWS\_CanTSyn\_00175]{DRAFT} [If Csm\_MacGenerate / Csm\_SignatureGenerate returns E\_NOT\_OK or CanTSynIcvGenerationTimeout expires before the notification of the CanTSyn\_IcvGenerationIndication callback, the Time Master shall:

- stop the ICV generation and accordingly fill 0 for ICVL field in message types 0x78, 0x88, 0x94, 0xA4,
- call IdsM\_SetSecurityEventWithContextData with the parameters EventId set to CANTSYN\_SEV\_ICV\_GENERATION\_FAILED (refer [SWS CanTSyn 00204])

(RS TS 20073)

[SWS\_CanTSyn\_00176]{DRAFT} [With the notification of the CanTSyn\_IcvGenerationIndication callback and successful generation of ICV, the Time Master shall add the generated ICV to ICV field in message types 0x78, 0x88, 0x94, 0xA4 and transmit the FUP, Extended OFS message.|(RS TS 20073)

[SWS\_CanTSyn\_00177]{DRAFT} [The Time Master shall notify the successful transmission of messages of types 0x78, 0x88, 0x94, 0xA4 to FVM by calling StbM\_-SPduTxConfirmation.|(RS\_TS\_20073)

## 7.4.6.7 Message Assembling

**[SWS\_CanTSyn\_00056]** [For each transmission of a Time Synchronization message the CanTSyn module shall assemble the message as follows:

- 1. Calculate OVS (FUP only)
- 2. Calculate SGW (FUP, OFNS and Extended OFS)
- 3. Calculate SC
- 4. Copy all data to the appropriate position within the related message
- 5. Calculate CRC (configuration dependent)
- 6. Fetch FV (configuration dependent) and append FVL, ICVL and FV in the appropriate position within the related message
- 7. Calculate ICV (configuration dependent) and append in the appropriate position within the related message

(RS TS 20033, RS TS 20035, RS TS 20036, RS TS 20073)

# 7.5 Acting as Time Slave

A Time Slave is an entity, which is the recipient for a certain Time Base within a certain segment of a communication network, being a consumer for this Time Base.

# 7.5.1 SYNC and FUP message processing

[SWS\_CanTSyn\_00057] [The CanTSyn shall only accept a SYNC message with Type equal to 0x20 and a correct CRC value if CanTSynRxCrcValidated is configured to CRC\_VALIDATED.|(RS\_TS\_20034, RS\_TS\_20035)

[SWS\_CanTSyn\_00058] [The CanTSyn shall only accept a SYNC message with Type equal to 0x10 if CanTSynRxCrcValidated is configured to CRC\_NOT\_VALIDATED.|(RS\_TS\_20035)

[SWS\_CanTSyn\_00059] [The CanTSyn shall only accept a SYNC message with Type equal to 0x10 or 0x20 if CanTSynRxCrcValidated is configured to CRC\_-IGNORED.|(RS TS 20035)

[SWS\_CanTSyn\_00109] [The CanTSyn shall only accept a SYNC message with Type equal to 0x10 or a SYNC message with Type equal to 0x20 and a correct CRC value if CanTSynRxCrcValidated is configured to CRC\_OPTIONAL. | (RS TS 20034, RS TS 20035)

[SWS\_CanTSyn\_00178]{DRAFT} [If CanTSynRxIcvVerificationType is configured to ICV\_VERIFIED, the CanTSyn shall perform ICV verification for FUP messages with ICV (Message type: 0x78, 0x88).

The Cantsyn shall consider ICV verification as failed for FUP messages without ICV (Message type:  $0 \times 18$ ,  $0 \times 28$ ). | (RS TS 20073)

[SWS\_CanTSyn\_00179]{DRAFT} [If CanTSynRxIcvVerificationType is configured to ICV\_NOT\_VERIFIED, the CanTSyn shall not perform the ICV verification and the FUP messages shall not contain an ICV value (Message type: 0x18, 0x28).

The Cantsyn shall consider ICV verification as failed for FUP messages with ICV (Message Type:  $0 \times 78$ ,  $0 \times 88$ ). | (RS\_TS\_20073)

[SWS\_CanTSyn\_00180]{DRAFT} [If CanTSynRxIcvVerificationType is configured to ICV\_IGNORED, the CanTSyn shall not perform the ICV verification.

The CantSyn shall ignore the ICV in FUP messages with ICV (Message type:  $0 \times 78$ ,  $0 \times 88$ ).  $J(RS_TS_20073)$ 

[SWS\_CanTSyn\_00181]{DRAFT} [If CanTSynRxIcvVerificationType is configured to ICV\_OPTIONAL, the CanTSyn shall perform ICV verification for FUP messages with ICV (Message type: 0x78, 0x88).

The Cantsyn shall not perform ICV verification for FUP messages without ICV (Message type: 0x18, 0x28).

(RS\_TS\_20073)

[SWS\_CanTSyn\_00060] [If CanTSynRxCrcValidated is configured to CRC\_VALIDATED, the CanTSyn shall only accept a FUP message

- with a Sequence Counter identical to the value of the corresponding SYNC message
- and Type equal to 0x28 or 0x88
- and a correct CRC value.

(RS\_TS\_20034, RS\_TS\_20035)

[SWS\_CanTSyn\_00061] [If CanTSynRxCrcValidated is configured to CRC\_NOT\_-VALIDATED, the CanTSyn shall only accept a FUP message

- with a Sequence Counter identical to the value of the corresponding SYNC message
- and Type equal to 0x18 or 0x78.

|(RS\_TS\_20034, RS\_TS\_20035)

[SWS\_CanTSyn\_00062] [If CanTSynRxCrcValidated is configured to CRC\_IGNORED, the CanTSyn shall only accept a FUP message

- with a Sequence Counter identical to the value of the corresponding SYNC message
- and Type equal to 0x18, 0x28, 0x78 and 0x88.

(RS TS 20034, RS TS 20035)

[SWS\_CanTSyn\_00110] [If CanTSynRxCrcValidated is configured to CRC\_OPTIONAL, the CanTSyn shall only accept

- a FUP message with an identical Sequence Counter to the value of the corresponding SYNC message and Type equal to 0x18 or 0x78
- or a FUP message with an identical sequence counter to the value of the corresponding SYNC message and Type equal to 0x28 or 0x88 and a correct CRC value.

|(RS\_TS\_20034, RS\_TS\_20035)|

[SWS\_CanTSyn\_00063] [For each configured Time Slave (refer to CanTSynGlobalTimeSlave) the CanTSyn module shall observe the reception timeout CanTSynGlobalTimeFollowUpTimeout between the SYNC and its FUP message.

If the reception timeout occurs the sequence shall be reset (i.e., waiting for a new SYNC message). \[ (RS\_TS\_20034, RS\_TS\_20035) \]

[SWS\_CanTSyn\_00182]{DRAFT} [If the SYNC message is received while the CanTSynGlobalTimeFollowUpTimeout is running, the Time Slave shall discard the received SYNC message, reset the sequence (i.e. waiting for a new SYNC) and raise the security event CANTSYN\_SEV\_SYNC\_FUP\_SEQUENCE\_ERROR (refer [SWS\_CanTSyn\_00204]).|(RS\_TS\_20073)

**Note:** The general timeout monitoring for the Time Base update is located in the StbM and not in the Timesync modules.

[SWS\_CanTSyn\_00064] [For a valid pair of SYNC and FUP messages with successfully validated set of values <code>SyncTimeSec</code>, <code>OVS</code> and <code>SyncTimeNSec</code> a new Synclocal Time Tuple [TL<sub>Sync</sub>;T3<sub>VLT</sub>] (refer to [5]), consisting of the Global Time value and the associated value of the Virtual Local Time, shall be calculated (refer to [SWS\_CanTSyn\_00146], [SWS\_CanTSyn\_00147], [SWS\_CanTSyn\_00148]) and forwarded to the <code>StbM</code> module via <code>StbM\_BusSetGlobalTime.</code>] (RS\_TS\_20032, RS\_TS\_20034)

**Note:** For the detailed sequence of actions to derive a new Synclocal Time Tuple refer to Figure 9.4

[SWS\_CanTSyn\_00183]{DRAFT} [During CanTSynGlobalTimeRxDebounceTime if any SYNC or FUP message received, the Time Slave shall discard the received message, reset the sequence (i.e. waiting for a new SYNC) and raise the security event CANTSYN\_SEV\_SYNC\_FUP\_SEQUENCE\_ERROR (refer [SWS\_CanTSyn\_00204]).|(RS\_TS\_20073)

#### 7.5.2 OFS and OFNS message processing

[SWS\_CanTSyn\_00065] [If CanTSynRxCrcValidated is configured to CRC\_VALIDATED, the CanTSyn shall only accept an OFS message

- with Type equal to 0x44, 0x64 or 0xA4
- and a correct CRC value.

(RS TS 20034, RS TS 20036)

[SWS\_CanTSyn\_00066] [If CanTSynRxCrcValidated is configured to CRC\_NOT\_-VALIDATED, the CanTSyn shall only accept an OFS message with Type equal to 0x34, 0x54 or 0x94. | (RS\_TS\_20036)

[SWS\_CanTSyn\_00067] [If CanTSynRxCrcValidated is configured to CRC\_IGNORED, the CanTSyn shall only accept an OFS message with Type equal to 0x34, 0x44, 0x54, 0x64, 0x94 or 0xA4.] (RS TS 20036)

[SWS\_CanTSyn\_00113] [If CanTSynRxCrcValidated is configured to CRC\_OP-TIONAL, the CanTSyn shall only accept

• an OFS message with Type equal to 0x34, 0x54 or 0x94

• or an OFS message with Type equal to 0x44, 0x64 or 0xA4 and a correct CRC value.

|(RS\_TS\_20034, RS\_TS\_20036)

[SWS\_CanTSyn\_00184]{DRAFT} [If CanTSynRxIcvVerificationType is configured to ICV\_VERIFIED, the CanTSyn shall perform ICV verification for Extended OFS messages with ICV messages (Message type: 0x94, 0xA4).

The Cantsyn shall consider ICV verification as failed for Extended OFS messages without ICV (Message type: 0x54, 0x64).|(RS TS 20073)

[SWS\_CanTSyn\_00185]{DRAFT} [If CanTSynRxIcvVerificationType is configured to ICV\_NOT\_VERIFIED, the CanTSyn shall not perform the ICV verification and the Extended OFS messages shall not contain an ICV value (Message type:  $0 \times 54$ ,  $0 \times 64$ ).

The Cantsyn shall consider ICV verification as failed for Extended OFS messages with ICV (Type: 0x94, 0xA4). | (RS\_TS\_20073)

[SWS\_CanTSyn\_00186]{DRAFT} [If CanTSynRxCrcValidated is configured to ICV IGNORED, the CanTSyn shall not perform the ICV verification.

The Cantsyn shall ignore the ICV in Extended OFS messages with ICV (Message type: 0x94, 0xA4).|(RS\_TS\_20073)

[SWS\_CanTSyn\_00187]{DRAFT} [If CanTSynRxIcvVerificationType is configured to ICV\_OPTIONAL, the CanTSyn shall perform ICV verification for Extended OFS messages with ICV (Message type: 0x94, 0xA4).

The Cantsyn shall not perform ICV verification for Extended OFS messages without ICV (Message type: 0x54, 0x64).](RS\_TS\_20073)

[SWS\_CanTSyn\_00068] [The CanTSyn shall only accept an OFNS message with an identical Sequence Counter to the value of the corresponding OFS message and Type equal to 0x4C and a correct CRC value if CanTSynRxCrcValidated is configured to CRC\_VALIDATED.|(RS\_TS\_20034, RS\_TS\_20036)

[SWS\_CanTSyn\_00069] [The CanTSyn shall only accept an OFNS message with an identical Sequence Counter to the value of the corresponding OFS message and Type equal to  $0 \times 3C$  if CanTSynRxCrcValidated is configured to CRC\_VALIDATED.] (RS TS 20036)

[SWS\_CanTSyn\_00070] [The CanTSyn shall only accept an OFNS message with an identical Sequence Counter to the value of the corresponding OFS message and Type equal to 0x3C or 0x4C if CanTSynRxCrcValidated is configured to CRC\_IGNORED.] (RS TS 20036)

[SWS\_CanTSyn\_00114] [The CanTSyn shall only accept

an OFNS message with a Sequence Counter identical to the value of the corresponding OFS message and Type equal to 0x3C

 or an OFNS message with a identical Sequence Counter identical to the value of the corresponding OFS message and Type equal to 0x4C and a correct CRC value

if CantSynRxCrcValidated is configured to CRC\_OPTIONAL.
|(RS TS 20034, RS TS 20036)

[SWS\_CanTSyn\_00071] [If CanTSynUseExtendedMsgFormat is FALSE, the CanTSyn shall observe for each configured Time Slave (CanTSynGlobal-TimeSlave) the reception timeout CanTSynGlobalTimeFollowUpTimeout between the OFS and its OFNS message.

If the reception timeout occurs the sequence shall be reset (i.e. waiting for a new OFS message). | (RS\_TS\_20034, RS\_TS\_20036, RS\_TS\_20068)

**Note:** The general timeout monitoring for the Time Base update is located in the StbM and not in the Timesync modules.

[SWS\_CanTSyn\_00072] [For a valid pair of OFS and OFNS messages and if CanTSynUseExtendedMsgFormat is FALSE, the CanTSyn shall calculate a new Time Tuple, consisting of the Offset Time value and the associated value of the Virtual Local Time, (according to [SWS\_CanTSyn\_00074]) and forward it to the StbM module via StbM\_BusSetGlobalTime.

If CanTSynUseExtendedMsgFormat is TRUE, the CanTSyn shall calculate a new Time Tuple, consisting of the Offset Time value and the associated value of the Virtual Local Time, (according to [SWS\_CanTSyn\_00074]) after receiving a valid Extended OFS message and forward it to the StbM module via StbM\_BusSetGlobalTime. | (RS\_TS\_20032, RS\_TS\_20034, RS\_TS\_20068)

[SWS\_CanTSyn\_00116] [On an invocation of StbM\_BusSetGlobalTime the parameter pathDelay of the measureDataPtr structure shall be set to  $0.](RS\_TS\_20034)$ 

### 7.5.3 Validation and Disassembling of Time Synchronization Messages

This chapter describes the workflow, how the items of a Time Synchronization message will be validated (1<sup>st</sup> step) and how the message will be disassembled (2<sup>nd</sup> step).

#### 7.5.3.1 Global Time Calculation

In addition to the message fields (refer to chapter section 7.3)

- SyncTimeSec
- ovs and
- SyncTimeNSec,

which are actually received by the Time Slave on the bus from the Time Master, this chapter defines and uses the following internal variables for calculation of the Rx Time Tuple for Synchronized Time Domains:

- T0: Global Time (seconds portion) received from Time Master in SYNC message
- T1<sub>VLT</sub>: Ingress timestamp of SYNC message as captured by CAN controller hardware or captured in CanTSyn\_RxIndication
- TL<sub>Sync</sub>: Local Instance of Global Time calculated by Time Slave and first part of the Rx Time Tuple
- T2<sub>VLT</sub>: Equivalent timestamp of SYNC message converted to StbM's Virtual Local Time domain and second part of the Rx Time Tuple
- T3<sub>VLT</sub>: Current time read out by CAN controller hardware
- T4: Correction value for T0 as received from the Time Master. It is calculated from values of OVS and SyncTimeNSec field in the FUP message.
- T<sub>SRD</sub>: SYNC reception delay as difference between T3<sub>VLT</sub> and T1<sub>VLT</sub>

Refer to Figure 1.1 and to the sequence diagram in Figure 9.4 as well as to the flow chart in Figure 7.2 for a better understanding of all steps of the Global Time calculation sequence of the Time Slave as specified in the requirements below.

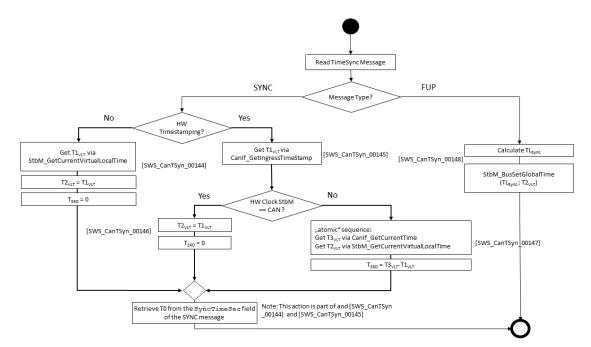

Figure 7.2: Rx message processing

[SWS\_CanTSyn\_00144]{DRAFT} [For a Time Slave, on invocation of CanTSyn\_-RxIndication for a SYNC message, and if CanTSynHardwareTimestampSupport is set to FALSE, CanTSyn shall

- 1. immediately establish a protection against interruption
- 2. and directly afterwards retrieve the reference time T1<sub>VLT</sub> for the SYNC message via StbM GetCurrentVirtualLocalTimeTime from the StbM

**Note:** Once T1<sub>VLT</sub> has been retrieved, protection against interruptions may be released

- 3. set the  $T2_{VLT}$  part of the Rx Time Tuple to the value of  $T1_{VLT}$  (i.e.,  $T2_{VLT} = T1_{VLT}$ )
- 4. set the SYNC reception delay  $T_{\text{SRD}}$  to 0
- 5. retrieve T0 from the SyncTimeSec field of the SYNC message

|(RS\_TS\_20035, RS\_TS\_20070)

**Note:** Immediate protection against interruptions means that there shall be no frame checks before (if called in context of the RX interrupt with interrupt nesting disabled, interrupt protection is typically implicitly ensured by the controller). Once the interrupts are locked, it is ok to check whether the received message is a SYNC message for which a snapshot of the Virtual Local Time shall be taken, but no other frame checks (e.g., CRC validation, SC validation, etc.) shall be done before taking  $T1_{VLT}$ . Once  $T1_{VLT}$  has been sampled it is ok to remove the protection against interruptions and to make the necessary validations. This means that  $T1_{VLT}$  will be taken even if the succeeding validations fail and thus making the snapshot superfluous.

[SWS\_CanTSyn\_00145]{DRAFT} [For a Time Slave, on invocation of CanTSyn\_-RxIndication for a SYNC message, and if CanTSynHardwareTimestampSupport is set to TRUE, CanTSyn shall

- retrieve T1<sub>VLT</sub> from the ingress timestamp of the SYNC message via CanIf\_-GetIngressTimestamp
- convert T1<sub>VLT</sub> to a representation in ns
- retrieve T0 from the SyncTimeSec field of the SYNC message

(RS TS 20035)

[SWS\_CanTSyn\_00146]{DRAFT} [For a Time Slave, on invocation of CanTSyn\_-RxIndication for a SYNC message

- and if CantSynHardwareTimestampSupport is set to TRUE
- and if the StbM uses the CAN controller hardware counter as Virtual Local Time source for the Time Base (refer to StbMLocalTimeClock),

CanTSyn shall

- set  $T2_{VLT}$  part of the Rx Time Tuple to the value of  $T1_{VLT}$  (i.e.,  $T2_{VLT} = T1_{VLT}$ )
- and set the SYNC reception delay T<sub>SRD</sub> to 0.

(RS TS 20035)

[SWS\_CanTSyn\_00147]{DRAFT} [For a Time Slave, on invocation of CanTSyn\_-RxIndication for a SYNC message,

- and if CantSynHardwareTimestampSupport is set to TRUE
- and if the StbM does not use the CAN controller hardware counter as Virtual Local Time source for the Time Base (refer to StbMLocalTimeClock)

CanTSyn shall correlate the CAN HW time and the Virtual Local Time of the StbM by applying the following sequence:

- 1. protect the following two steps against interruptions
- 2. retrieve the current time of the CAN controller hardware counter via CanIf\_-GetCurrentTime and convert it to the Virtual Local Time T3<sub>VLT</sub>,
- 3. retrieve the current value of the Virtual Local Time of the corresponding Time Base in the StbM via StbM\_GetCurrentVirtualTime as T2<sub>VLT</sub>,
- 4. calculate the SYNC reception delay  $T_{SRD}$  as  $(T3_{VLT} T1_{VLT})$

](RS\_TS\_20035, RS\_TS\_20070)

**Note:** In the above sequence protection against interruptions is important, because any interruption of the sequence of step 2 and step 3 would worsen the precision of the local instance of the Global Time

[SWS\_CanTSyn\_00148]{DRAFT} [For a Time Slave, on invocation of CanTSyn\_-RxIndication for a FUP message, CanTSyn shall

- 1. retrieve the following data from the FUP message
  - the OVS field
  - and the SyncTimeSec field
- 2. and calculate T4 = OVS + SyncTimeSec

Either in the same Rx indication routine (CanTSyn\_RxIndication) or in the subsequent CanTSyn\_MainFunction invocation CanTSyn shall

- 1. calculate  $TL_{SYNC}$  as  $TL_{SYNC} = (T0 + T4 + T_{SRD})$
- 2. and forward the new Rx Time Tuple [TL $_{SYNC}$ ; T2 $_{VLT}$ ] to the StbM via StbM $_-$ BusSetGlobalTime

(RS TS 20035)

**Note:** In the above sequence protection against interruptions is important, because any interruption of the sequence of step 2 and step 3 would worsen the precision of local instance of the Global Time, which depends on time tuple [TL<sub>Sync</sub>;T3<sub>VIT</sub>].

**[SWS\_CanTSyn\_00074]** [The receiver of an Offset Time Base shall perform the following steps to assemble the Offset Time:

- 1. Get seconds portion of the Offset Time out of OfsTimeSec
- 2. Get nanoseconds portion of the Offset Time out of OfsTimeNSec
- 3. Retrieve current Virtual Local Time value via StbM\_GetCurrentVirtualLo-calTime

(RS TS 20036)

**Note:** OFS and OFNS messages are not time stamped.

#### 7.5.3.2 OVS Consideration

[SWS\_CanTSyn\_00075] [OVS (FUP only) shall be considered on the receiver side to retrieve the second portion of the received Synchronized Time Base.] (RS TS 20035)

#### 7.5.3.3 SGW Calculation

[SWS\_CanTSyn\_00133] [If the SGW value (FUP, OFNS and Extended OFS) is set to SyncToSubDomain, the SYNC\_TO\_GATEWAY bit within timeBaseStatus shall be set to TRUE. Otherwise, it shall be set to FALSE. | (RS\_TS\_20032, RS\_TS\_20034)

#### 7.5.3.4 Sequence Counter Validation

[SWS\_CanTSyn\_00076] The Sequence Counter of each SYNC message must match to the Sequence Counter of the next incoming FUP message of the same Time Domain. Otherwise, the contents of the already received SYNC message shall be discarded and the received FUP message shall be ignored.

| (RS TS 20034, RS TS 20035)

[SWS\_CanTSyn\_00077] [If CanTSynUseExtendedMsgFormat is FALSE, the Sequence Counter of each OFS message must match to the Sequence Counter of the next incoming OFNS message of the same Time Domain. If the SCs do not match, the received OFNS message shall be ignored and the contents of the already received OFS message shall be discarded. | (RS\_TS\_20034, RS\_TS\_20036, RS\_TS\_20068)

**[SWS\_CanTSyn\_00078]** [The Sequence Counter Jump Width between two consecutive SYNC or two consecutive OFS messages of the same Time Domain shall be greater than 0 and smaller than or equal to CanTSynGlobalTimeSequenceCounterJumpWidth. Otherwise, a Time Slave shall ignore the respective SYNC / OFS message.

If the CantsynGlobalTimeSequenceCounterJumpWidth value is set to 0, the Time Slave shall not do Sequence Counter Jump Width checks. (RS\_TS\_20034, RS\_TS\_20035, RS\_TS\_20036)

[SWS\_CanTSyn\_00079] [Upon reception of a SYNC (or OFS) message a Time Slave shall check the Sequence Counter of the received message per Time Domain against the configured value of CanTSynGlobalTimeSequenceCounterJumpWidth (according to [SWS\_CanTSyn\_00078]), unless it is the first message

- at Startup or
- after a Time Base update timeout has been detected (TIMEOUT bit set in Time Base synchronization status timeBaseStatus).

(RS TS 20034, RS TS 20035, RS TS 20036)

**Note:** There are scenarios when it makes sense to skip the check of the Sequence Counter Jump Width, e.g. at startup (Time Slaves start asynchronously to the Time Master) or after a message timeout to allow for Sequence Counter (re)synchronization. In case of a timeout the error has been detected already by the timeout monitoring, there is no benefit in generating a subsequent error by the jump width check.

**Note:** According to [SWS\_CanTSyn\_00078] the Sequence Counter validation will still discard messages with a Sequence Counter Jump Width being zero (i.e., stuck Sequence Counter) during Time Base update timeout.

[SWS\_CanTSyn\_00143] [While a Time Base Timeout is present (TIMEOUT bit is set in Time Base synchronization status timeBaseStatus), CanTSyn shall discard SYNC/FUP (or OFS/OFNS) messages until it has successfully validated (refer to [SWS\_CanTSyn\_00078]) n consecutive SYNC/FUP (or OFS/OFNS) message pairs (n is given by the parameter CanTSynGlobalTimeSequenceCounterHysteresis).] (RS\_TS\_20034)

**Note:** [SWS\_CanTSyn\_00143] improves robustness against a scenario with a buggy master implementation or injection of invalid master messages (sequence counter increments greater than CanTSynGlobalTimeSequenceCounterJumpWidth. In such a scenario any valid message pair would cause the Time Slave to leave the Timeout state (refer to [SWS\_CanTSyn\_00079]) although the sequence counter is not incremented correctly. An additional hysteresis avoids this.

#### 7.5.3.5 CRC Validation

[SWS\_CanTSyn\_00080] [The function Crc\_CalculateCRC8H2F as defined in [6] shall be used to validate the CRC if configured.

| (RS TS 20034, RS TS 20035, RS TS 20036)

[SWS\_CanTSyn\_00084] [The DataID shall be calculated as DataID = Data IDList[SC], where DataIDList is given by configuration for each message Type.] (RS TS 20034, RS TS 20035)

**Note:** A specific <code>DataID</code> out of a predefined <code>DataIDList</code> ensures the identification of data elements of time synchronization messages.

[SWS\_CanTSyn\_00085] [If CanTSynUseExtendedMsgFormat is FALSE, the CRC shall be calculated over Time Synchronization message byte 2 to byte 7 and DataID, where byte 2 is applied first, followed by the other bytes in ascending order, and Data ID last.

If CanTSynUseExtendedMsgFormat is TRUE, the CRC shall be calculated over Time Synchronization message byte 2 to byte 15 and DataID for Extended Timesync message formats, where byte 2 is applied first, followed by the other bytes in ascending order, and DataID last.

(RS TS 20034, RS TS 20035, RS TS 20036, RS TS 20068)

#### 7.5.3.6 ICV Verification

Refer to the chapter 7.3.13 in StbM [5] for the configuration details of  $\mathbb{FV}$  referenced in each Time Domain.

[SWS\_CanTSyn\_00188]{DRAFT} [When the FV is referenced (refer CanTSyn\_IcvVerificationFvIdRef) and FVL > 0 in the received FUP or Extended OFS message, the Time Slave shall call the StbM\_GetRxFreshness Api to obtain the Freshness Value by using

- the StbMFreshnessValueId from the reference CanTSynIcvVerificationFvIdRef
- the StbMTruncatedFreshnessValue as received in the FV field of the FUP message
- the StbMTruncatedFreshnessValueLength as received in the FVL field of the FUP message
- the StbMAuthVerifyAttempts as the number of failed verification attempts for the current message (ICV verification attempt counter)
- the StbMFreshnessValueLength from the reference CanTSynIcvVerificationFvIdRef

(RS TS 20073)

**[SWS\_CanTSyn\_00189]**{DRAFT} [When the FVL is 0 in the received FUP or Extended OFS message, the Time Slave shall not include the FV in the ICV verification.] (RS TS 20073)

[SWS\_CanTSyn\_00190]{DRAFT} [When the FV is not referenced (refer CanTSyn-IcvVerificationFvIdRef) and FVL > 0 in the received FUP or Extended OFS message, the Time Slave shall stop the ICV verification and consider ICV verification as failed.] (RS TS 20073)

[SWS\_CanTSyn\_00191]{DRAFT} [If StbM\_GetRxFreshness returns E\_OK, the Time Slave shall use the FV in ICV verification.]  $(RS_TS_20073)$ 

[SWS\_CanTSyn\_00192]{DRAFT} [If StbM\_GetRxFreshness returns E\_NOT\_OK, the current ICV verification of the received FUP or Extended OFS message is considered to be failed, and the Time Slave shall

- retry calling StbM\_GetRxFreshness in the next Main Function
- increment the ICV verification attempt counter for this FUP or Extended OFS message

(RS TS 20073)

[SWS\_CanTSyn\_00193]{DRAFT} [If the ICV verification attempt counter has reached CanTSynIcvVerificationAttempts, then the ICV verification of received FUP or Extended OFS message is considered to be failed and the Time Slave shall:

- stop the ICV verification and consider the ICV verification as failed,
- call Det\_ReportRuntimeError with the parameter Errorld set to CANTSYN\_ E FRESHNESSFAILURE (refer [SWS CanTSyn 91001]),
- call IdsM\_SetSecurityEventWithContextData with the parameter
  EventId set to CANTSYN\_SEV\_ICV\_VERIFICATION\_FAILED (refer to
  [SWS\_CanTSyn\_00204])

(RS TS 20073)

Refer to the chapter 10.2.5 in [7] for the configuration details of CSM job used for ICV verification.

[SWS\_CanTSyn\_00194]{DRAFT} [If CanTSynIcvVerificationBase for the Time Domain is configured to ICV\_MAC, the Time Slave shall call Csm\_MacVerify to verify the ICV value.] ( $RS_TS_20073$ )

[SWS\_CanTSyn\_00195]{DRAFT} [If CanTSynIcvVerificationBase for the Time Domain is configured to ICV\_SIGNATURE, the Time Slave shall call Csm\_SignatureVerify to verify the ICV value. | (RS\_TS\_20073)

**Note:** The mode parameter is intentionally left open for the implementer to choose (i.e. CRYPTO\_OPERATIONMODE\_SINGLECALL would possibly be the best option since it does not require further calls to CSM).

The CSM job used to generate the ICV can be configured to synchronous or asynchronous behaviour.

**[SWS\_CanTSyn\_00196]**{DRAFT} [The ICV verification timeout observation is disabled, when the CSM job to verify ICV is configured in synchronous behaviour. In this case, the CantSynIcvVerificationTimeout shall be set to  $0.|(RS_TS_20073)|$ 

[SWS\_CanTSyn\_00197]{DRAFT} [If Csm\_MacVerify or Csm\_SignatureVerify returns E\_OK, the Time Slave shall start the CanTSynIcvVerificationTimeout.] (RS TS 20073)

[SWS\_CanTSyn\_00198]{DRAFT} [The CanTSynIcvVerificationTimeout shall be stopped with the notification of the CanTSyn\_IcvVerificationIndication callback.|(RS TS 20073)

[SWS\_CanTSyn\_00199]{DRAFT} [If Csm\_MacVerify or Csm\_SignatureVerify returns recoverable error code (e.g., CRYPTO\_E\_BUSY), the verification of received FUP or Extended OFS message is considered to be failed and the verification attempt counter for this PDU shall be incremented. | (RS TS 20073)

**[SWS\_CanTSyn\_00200]**{DRAFT} [If one of the following conditions is true:

- the ICV verification attempt counter has reached the configuration value CanTSynIcvVerificationTimeout
- the verification of the ICV (CanTSyn\_IcvVerificationIndication or Csm\_MacVerify / Csm\_SignatureVerify when synchronous behavior is used) has returned a non-recoverable error such as returning E\_NOT\_OK or KEY\_FAILURE
- CanTSynIcvVerificationTimeout expires before the notification of the CanTSyn\_IcvVerificationIndication callback,

#### the Time Slave shall:

- stop the ICV verification and consider the ICV verification as failed,
- call IdsM\_SetSecurityEventWithContextData with the parameters
  EventId set to CANTSYN\_SEV\_ICV\_VERIFICATION\_FAILED (refer to
  [SWS CanTSyn 00204])

(RS\_TS\_20073)

### 7.5.3.7 Message Disassembling

**[SWS\_CanTSyn\_00086]** For each received Time Synchronization message the CanTSyn shall validate the message as follows (all conditions must match):

- 1. Type matches depending on the CantSynRxCrcValidated parameter
- 2. SC value is within the accepted range (refer to [SWS\_CanTSyn\_00078] and [SWS\_CanTSyn\_00079])
- 3. D matches to the defined Time Domain range for each Type
- **4.** D matches to one of the configured Time Domains (given by parameter CanTSynGlobalTimeDomainId)
- 5. SyncTimeNSec (FUP / OFNS / Extended OFS only) matches the defined range of StbM\_TimeStampType.nanoseconds.
- 6. CRC (including DataID) matches depending on the CantSynRxCrcValidated parameter

7. ICV matches depending on the CantsynRxIcvVerificationType parameter | (RS\_TS\_20035, RS\_TS\_20036, RS\_TS\_20073)

[SWS\_CanTSyn\_00087] [If the validation of received Time Synchronization message is successful (refer to [SWS\_CanTSyn\_00086]), the CanTSyn shall disassemble the message and forward the global time via StbM\_BusSetGlobalTime to StbM.] (RS\_-TS\_20034, RS\_TS\_20035, RS\_TS\_20036, RS\_TS\_20073)

[SWS\_CanTSyn\_00206] [If the validation of the received Time Synchronization message has failed (refer to [SWS\_CanTSyn\_00086]), the CanTSyn shall discard the received Time Synchronization message.] (RS\_TS\_20035, RS\_TS\_20036, RS\_TS\_20073)

# 7.6 Time Recording

#### 7.6.1 Global Time Precision Measurement

[SWS\_CanTSyn\_00115] [On an invocation of StbM\_BusSetGlobalTime the parameter pathDelay of the measureDataPtr structure shall be set to 0.  $](RS\_TS\_20034)$ 

#### 7.6.2 Time Validation

[SWS\_CanTSyn\_00137] [The CanTSyn shall support Time Validation, if CanTSyn-TimeValidationSupport set to TRUE. | (RS\_TS\_00034)

```
[SWS_CanTSyn_00138] [
```

- CanTSynTimeValidationSupport is enabled and
- CantSynEnableTimeValidation for the Time Domain is enabled

CanTSyn shall do time recording for Time Validation for that Time Domain (RS TS 00034)

```
[SWS_CanTSyn_00139] |
```

- time recording for Time Validation is enabled for a Time Domain (refer to [SWS\_CanTSyn\_00115] and [SWS\_CanTSyn\_00116]) and
- Cantsyn is configured as Time Slave for that Time Domain,

CanTSyn shall call StbM\_CanSetSlaveTimingData upon successful reception of a FUP message.

StbM\_CanSetSlaveTimingData shall be called after StbM\_BusSetGlobalTime.  $](RS\_TS\_00034)$ 

**Note:** StbM\_BusSetGlobalTime shall be called first, because it updates the Synclocal Time Tuple (refer to [5]), which is required by StbM\_CanSetSlaveTimingData.

[SWS\_CanTSyn\_00140] [Upon invocation of StbM\_CanSetSlaveTimingData CanTSyn shall pass following values

- the sequence counter value from the transmitter (Time Master),
- the segment id of the physical channel on which the SYNC message has been received (refer to parameter CantSynGlobalTimeNetworkSegmentId)
- T2<sub>VLT</sub> as syncIngressTimestamp for the SYNC message (refer to step 1 in [SWS\_CanTSyn\_00144], [SWS\_CanTSyn\_00147] and [SWS\_CanTSyn\_00148]),
- T0 + T4 as preciseOriginTimestamp received from the Time Master (refer to [SWS\_CanTSyn\_00144] and [SWS\_CanTSyn\_00145])

to the function by the parameter measureDataPtr.

#### Struct members

- measureDataPtr→referenceLocalTimestamp and
- measureDataPtr→referenceGlobalTimestamp

shall be passed as 0.

(RS TS 00034)

**Note:** The CantSyn passes 0 to avoid undefined values. The structure members referenceLocalTimestamp and referenceGlobalTimestamp will be set by the StbM via StbM\_CanSetSlaveTimingData internally (refer to [SWS\_StbM\_00471] in [5]).

# [SWS\_CanTSyn\_00141] [

- time recording for Time Validation is enabled for a Time Domain (refer to [SWS\_CanTSyn\_00115] and [SWS\_CanTSyn\_00115]) and
- CanTSyn is configured as Time Master for that Time Domain

CanTSyn shall call StbM\_CanSetMasterValidationData upon successful transmission of a SYNC message). |(RS\_TS\_00034)

 $\begin{tabular}{ll} [SWS\_CanTSyn\_00142] & [Upon invocation of StbM\_CanSetMasterValidation-Data CanTSyn shall pass the following data \\ \end{tabular}$ 

the sequence counter as sent in the SYNC message

- the segment id of the physical channel on which the SYNC message has been sent (refer to parameter CanTSynGlobalTimeNetworkSegmentId)
- $\bullet$  T1<sub>VLT</sub> as the <code>syncEgressTimestamp</code> of SYNC message (refer to [SWS\_CanTSyn\_00149], [SWS\_CanTSyn\_00152] and [SWS\_CanTSyn\_00153]),
- T0<sub>SYNC</sub> + (T1<sub>VLT</sub> T0<sub>VLT</sub>) as precise preciseOriginTimestamp (refer to [SWS\_CanTSyn\_00149], [SWS\_CanTSyn\_00151], [SWS\_CanTSyn\_00152] and [SWS\_CanTSyn\_00153]),

to the function by the parameter measureDataPtr. | (RS TS 00034)

# 7.7 Security Events

[SWS\_CanTSyn\_00201]{DRAFT} [If security event reporting has been enabled for the CanTSyn module (CanTSynEnableSecurityEventReporting = TRUE) the respective security events shall be reported to the IdsM [8] via the interfaces defined in BSWGeneral [3]. | (RS Ids 00810)

The following table lists the security events which are standardized for the CanTSyn together with their trigger conditions.

# [SWS CanTSyn 00204] Security events for CanTSyn

Name	Description	ID
CANTSYN_SEV_ICV_GENERATION_FAILED	ICV generation for a Follow_Up message failed	66
CANTSYN_SEV_ICV_VERIFICATION_FAILED	ICV verification of a received Follow_Up message failed	67
CANTSYN_SEV_FRESHNESS_NOT_ AVAILABLE	Failed to get freshness value from FvM	68
CANTSYN_SEV_SYNC_FUP_SEQUENCE_ ERROR	Failed to receive correct sequence of SYNC and FUP or OFS and OFNS from the TimeMaster within (CanTSyn GlobalTimeFollowUpTimeout).	69

(RS Ids 00810)

The following table describes the context data which shall be reported for the respective security events:

# [SWS\_CanTSyn\_00205]{DRAFT} Context data of respective Security events of CanTSyn $\lceil$

Security Event	Context Data
CANTSYN_SEV_ICV_GENERATION_FAILED	Context Data (1 byte) - GlobalTimeDomainId
CANTSYN_SEV_ICV_VERIFICATION_FAILED	Context Data (1 byte) - GlobalTimeDomainId
CANTSYN_SEV_FRESHNESS_NOT_AVAILABLE	Context Data (1 byte) - GlobalTimeDomainId
CANTSYN_SEV_SYNC_FUP_SEQUENCE_ERROR	Context Data (1 byte) - GlobalTimeDomainId

(RS Ids 00810)

## 7.8 Error Classification

Section 7.2 "Error Handling" of the document "General Specification of Basic Software Modules" [3] describes the error handling of the Basic Software in detail. Above all, it constitutes a classification scheme consisting of five error types which may occur in BSW modules.

Based on this foundation, the following section specifies particular errors arranged in the respective subsections below.

# 7.8.1 Development Errors

### [SWS\_CanTSyn\_00089]

Type of error	Related error code	Error value
API service called with wrong PDU or SDU	CANTSYN_E_INVALID_PDUID	0x01
API service used in un-initialized state	CANTSYN_E_UNINIT	0x02
A pointer is NULL	CANTSYN_E_NULL_POINTER	0x03
CanTSyn initialization failed	CANTSYN_E_INIT_FAILED	0x04
API called with invalid parameter	CANTSYN_E_PARAM	0x05
Invalid Controller index	CANTSYN_E_INV_CTRL_IDX	0x06

(SRS BSW 00385)

#### 7.8.2 Runtime Errors

# [SWS\_CanTSyn\_91001]

Type of error Related error code		Error value
No FV available from the FVM	CANTSYN_E_FRESHNESSFAILURE	0x01

(SRS BSW 00385)

#### 7.8.3 Transient Faults

There are no transient faults.

#### 7.8.4 Production Errors

There are no production errors.

# 7.8.5 Extended Production Errors

There are no extended production errors.

# 8 API specification

# 8.1 Imported types

In this section all types included from the following files are listed:

# [SWS\_CanTSyn\_00090] [

Module	Header File	Imported Type	
Can	Can_GeneralTypes.h	Can_TimeStampType (draft)	
ComStack_Types ComStack_Types.h		PduldType	
	ComStack_Types.h	PduInfoType	
	ComStack_Types.h	PduLengthType	
Csm	Rte_Csm_Type.h	Crypto_OperationModeType	
	Rte_Csm_Type.h	Crypto_ResultType	
	Rte_Csm_Type.h	Crypto_VerifyResultType	
IdsM	ldsM_Types.h	ldsM_SecurityEventIdType	
StbM	Rte_StbM_Type.h	StbM_CanTimeMasterMeasurementType	
	Rte_StbM_Type.h	StbM_CanTimeSlaveMeasurementType	
	Rte_StbM_Type.h	StbM_SynchronizedTimeBaseType	
	Rte_StbM_Type.h	StbM_TimeBaseStatusType	
	Rte_StbM_Type.h	StbM_TimeStampShortType	
	Rte_StbM_Type.h	StbM_TimeStampType	
	Rte_StbM_Type.h	StbM_TimeTupleType	
	Rte_StbM_Type.h	StbM_UserDataType	
	StbM.h	StbM_MeasurementType	
	StbM.h	StbM_VirtualLocalTimeType	
Std	Std_Types.h	Std_ReturnType	
	Std_Types.h	Std_VersionInfoType	

](RS\_TS\_20035)

# 8.2 Type definitions

# 8.2.1 CanTSyn\_ConfigType

# [SWS\_CanTSyn\_00091] [

Name	CanTSyn_ConfigType	
Kind	Structure	
Elements	implementation specific	
	Type –	
	Comment	-

 $\triangle$ 

Description	This is the base type for the configuration of the Time Synchronization over CAN.	
	A pointer to an instance of this structure will be used in the initialization of the Time Synchronization over CAN.	
	The content of this structure is defined in chapter 10 Configuration specification.	
Available via	CanTSyn.h	

(RS\_TS\_20035)

# 8.2.2 CanTSyn\_TransmissionModeType

# [SWS\_CanTSyn\_00092]

Name	CanTSyn_TransmissionModeType		
Kind	Enumeration		
Range	CANTSYN_TX_OFF – Transmission Disabled		
	CANTSYN_TX_ON - Transmission Enabled		
Description	Handles the enabling and disabling of the transmission mode		
Available via	CanTSyn.h		

](RS\_TS\_20035)

# 8.3 Function definitions

# 8.3.1 CanTSyn\_Init

# [SWS\_CanTSyn\_00093]

Service Name	CanTSyn_Init	
Syntax	<pre>void CanTSyn_Init (   const CanTSyn_ConfigType* configPtr )</pre>	
Service ID [hex]	0x01	
Sync/Async	Synchronous	
Reentrancy	Non Reentrant	
Parameters (in)	configPtr	Pointer to selected configuration structure
Parameters (inout)	None	
Parameters (out)	None	
Return value	None	
Description	This function initializes the Time Synchronization over CAN.	
Available via	CanTSyn.h	

](RS\_TS\_20035)

CANTSYN\_E\_INIT\_FAILED is reported as specified by [SWS\_BSW\_00050] in [3]. See section 7.2.2 for details.

# 8.3.2 CanTSyn\_GetVersionInfo

# [SWS\_CanTSyn\_00094]

Service Name	CanTSyn_GetVersionInfo	
Syntax	void CanTSyn_GetVersionInfo ( Std_VersionInfoType* versioninfo )	
Service ID [hex]	0x02	
Sync/Async	Synchronous	
Reentrancy	Non Reentrant	
Parameters (in)	None	
Parameters (inout)	None	
Parameters (out)	versioninfo	Pointer to where to store the version information of this module.
Return value	None	
Description	Returns the version information of this module.	
Available via	CanTSyn.h	

(RS\_TS\_20035)

### 8.3.3 CanTSyn\_SetTransmissionMode

# [SWS\_CanTSyn\_00095]

Service Name	CanTSyn_SetTransmissionMode	
Syntax	<pre>void CanTSyn_SetTransmissionMode (    uint8 CtrlIdx,    CanTSyn_TransmissionModeType Mode )</pre>	
Service ID [hex]	0x03	
Sync/Async	Synchronous	
Reentrancy	Non Reentrant	
Parameters (in)	Ctrlldx	Index of the CAN channel
	Mode	CANTSYN_TX_OFF CANTSYN_TX_ON
Parameters (inout)	None	
Parameters (out)	None	
Return value	None	
Description	This API is used to turn on and off the TX capabilities of the CanTSyn.	
Available via	CanTSyn.h	

|(RS\_TS\_20035)

[SWS\_CanTSyn\_00134] [The function CanTSyn\_SetTransmissionMode shall inform the Det, if development error detection is enabled (i.e., CanTSynDevErrorDetect is set to TRUE) and if function call has failed because of the following reasons:

- Invalid Ctrlldx (CANTSYN\_E\_INV\_CTRL\_IDX)
- Invalid Mode (CANTSYN\_E\_PARAM)

(SRS BSW 00323, SRS BSW 00337)

#### 8.4 Callback notifications

This is a list of functions provided for other modules.

# 8.4.1 CanTSyn\_RxIndication

# [SWS\_CanTSyn\_00096]

Service Name	CanTSyn_RxIndication	
Syntax	void CanTSyn_RxIndication ( PduIdType RxPduId, const PduInfoType* PduInfoPtr )	
Service ID [hex]	0x42	
Sync/Async	Synchronous	
Reentrancy	Reentrant for different Pdulds. Non reentrant for the same Pduld.	
Parameters (in)	RxPduld	ID of the received PDU.
	PduInfoPtr	Contains the length (SduLength) of the received PDU, a pointer to a buffer (SduDataPtr) containing the PDU, and the MetaData related to this PDU.
Parameters (inout)	None	
Parameters (out)	None	
Return value	None	
Description	Indication of a received PDU from a lower layer communication interface module.	
Available via	CanTSyn.h	

#### (RS TS 20035)

**Note:** The callback function CanTSyn\_RxIndication called by the CAN Interface and implemented by the CanTSyn module. It is called in case of a receive indication event of the CAN Driver.

[SWS\_CanTSyn\_00097] [The callback function <code>CanTSyn\_RxIndication</code> shall inform the <code>Det</code>, if development error detection is enabled (<code>CanTSynDevErrorDetect</code> is set to TRUE) and if function call has failed because of the following reasons:

- Invalid PDU ID (CANTSYN E INVALID PDUID)
- PduInfoPtr or SduDataPtr equals NULL\_PTR (CANTSYN\_E\_NULL\_ POINTER)

(SRS BSW 00323, SRS BSW 00337)

Caveats of CanTSyn\_RxIndication:

• Until this service returns, the CAN Interface will not access <code>canSduPtr</code>. The <code>canSduPtr</code> is only valid and can be used by upper layers until the indication returns. The CAN Interface guarantees that the number of configured bytes for this <code>CanTSynRxPduId</code> is valid. The call context is either on interrupt level (interrupt mode) or on task level (polling mode). This callback service is re-entrant for multiple CAN controller usage.

**Note:** Using polling mode as call context significantly increases the latency and thus reduces the precision. It is therefore highly recommended to only use interrupt mode.

• The Cantsyn module is initialized correctly.

### 8.4.2 CanTSyn\_TxConfirmation

## [SWS CanTSyn 00099]

Service Name	CanTSyn_TxConfirmation	
Syntax	<pre>void CanTSyn_TxConfirmation (   PduIdType TxPduId,   Std_ReturnType result )</pre>	
Service ID [hex]	0x40	
Sync/Async	Synchronous	
Reentrancy	Reentrant for different Pdulds. Non reentrant for the same Pduld.	
Parameters (in)	TxPduld	ID of the PDU that has been transmitted.
	result	E_OK: The PDU was transmitted. E_NOT_OK: Transmission of the PDU failed.
Parameters (inout)	None	
Parameters (out)	None	
Return value	None	
Description	The lower layer communication interface module confirms the transmission of a PDU, or the failure to transmit a PDU.	
Available via	CanTSyn.h	

#### (RS TS 20035)

**Note:** The callback function CanTSyn\_TxConfirmation is called by the CAN Interface and implemented by the CanTSyn module.

[SWS\_CanTSyn\_00100] [The callback function CanTSyn\_TxConfirmation shall inform the Det, if development error detection is enabled (CanTSynDevErrorDetect is set to TRUE) and if the function call has failed because of the following reason:

• Invalid PDU ID (CANTSYN\_E\_INVALID\_PDUID), i.e., a PDU ID not configured by parameter CantSynGlobalTimeMasterConfirmationHandleId

(SRS BSW 00323, SRS BSW 00337)

Caveats of CanTSyn\_TxConfirmation:

• The call context is either on interrupt level (interrupt mode) or on task level (polling mode). This callback service is re-entrant for multiple CAN controller usage.

**Note:** Using polling mode as call context significantly increases the latency and thus reduces the precision. It is therefore highly recommended to only use interrupt mode.

• The Cantsyn module is initialized correctly.

## 8.4.3 CanTSyn\_lcvGenerationIndication

#### [SWS\_CanTSyn\_91002]{DRAFT}

Service Name	CanTSyn_lcvGenerationIndication (draft)			
Syntax	<pre>void CanTSyn_IcvGenerationIndication (     uint32 jobId,     Crypto_ResultType result )</pre>			
Service ID [hex]	0x7			
Sync/Async	Synchronous			
Reentrancy	Reentrant			
Parameters (in)	jobld JobID of the operation that caused the callback.			
	result Contains the result of the cryptographic operation.			
Parameters (inout)	None			
Parameters (out)	None			
Return value	None			
Description	By this API service the CanTSyn gets an indication and the result of ICV generation.			
	Tags: atp.Status=draft			
Available via	CanTSyn.h			

### |(RS\_TS\_20073)

[SWS\_CanTSyn\_00202]{DRAFT} [The function CanTSyn\_IcvGenerationIndication shall inform the DET, if development error detection is enabled (CanTSynDevErrorDetect is set to TRUE) and if function call has failed because of the following reasons:

• jobId is invalid (CANTSYN\_E\_PARAM)

(SRS BSW 00323, SRS BSW 00337)

#### 8.4.4 CanTSyn\_IcvVerificationIndication

#### [SWS\_CanTSyn\_91003]{DRAFT}

Service Name	CanTSyn_lcvVerificationIndication (draft)			
Syntax	void CanTSyn_IcvVerificationIndication (     uint32 jobId,     Crypto_ResultType result )			
Service ID [hex]	0x8	0x8		
Sync/Async	Synchronous			
Reentrancy	Reentrant			
Parameters (in)	jobld JobID of the operation that caused the callback.			
	result Contains the result of the cryptographic operation.			
Parameters (inout)	None			
Parameters (out)	None			

Return value	None
Description	By this API service the CanTSyn gets an indication and the result of ICV verification.
	Tags: atp.Status=draft
Available via	CanTSyn.h

(RS\_TS\_20073)

[SWS\_CanTSyn\_00203]{DRAFT} [The function CanTSyn\_lcvVerificationIndication() shall inform the DET, if development error detection is enabled (CanTSynDevErrorDetect is set to TRUE) and if function call has failed because of the following reasons:

jobld is invalid (CANTSYN\_E\_PARAM)

(SRS\_BSW\_00323, SRS\_BSW\_00337)

#### 8.5 Scheduled functions

These functions are directly called by the Basic Software Scheduler. The following functions shall have no return value and no parameters. All functions shall be non-reentrant.

#### 8.5.1 CanTSyn\_MainFunction

#### [SWS\_CanTSyn\_00102]

Service Name	CanTSyn_MainFunction
Syntax	<pre>void CanTSyn_MainFunction (   void )</pre>
Service ID [hex]	0x06
Description	Main function for cyclic call / resp. Timesync message transmission
Available via	CanTSyn_SchM.h

|(RS\_TS\_20035)

[SWS\_CanTSyn\_00103] [The frequency of invocations of CanTSyn\_MainFunction is determined by the configuration parameter CanTSynMainFunctionPeriod.|(RS\_TS\_20035)

## 8.6 Expected interfaces

In this chapter all interfaces required from other modules are listed.

## 8.6.1 Mandatory interfaces

Note: This section defines all interfaces, which are required to fulfill the core functionality of the module.

### [SWS\_CanTSyn\_00105]

API Function	Header File	Description
StbM_GetCurrentVirtualLocalTime	StbM.h	Returns the Virtual Local Time of the referenced Time Base.

](RS\_TS\_20035)

#### 8.6.2 Optional interfaces

This section defines all interfaces, which are required to fulfill an optional functionality of the module.

## [SWS\_CanTSyn\_00106]

API Function	Header File	Description
Canlf_EnableEgressTimeStamp (draft)	Canlf.h	This service calls the corresponding CAN Driver service to activate egress time stamping on a dedicated message object.
		Tags: atp.Status=draft
Canlf_GetCurrentTime (draft)	Canlf.h	This service calls the corresponding CAN Driver service to retrieve the current time value out of the HW registers.
		Tags: atp.Status=draft
Canlf_GetEgressTimeStamp (draft)	Canlf.h	This service calls the corresponding CAN Driver service to read back the egress time stamp on a dedicated message object. It needs to be called within the TxConfirmation() function.
		Tags: atp.Status=draft
Canlf_GetIngressTimeStamp (draft)	Canlf.h	This service calls the corresponding CAN Driver service to reads back the ingress time stamp on a dedicated message object. It needs to be called within the RxIndication() function.
		Tags: atp.Status=draft
CanIf_Transmit	Canlf.h	Requests transmission of a PDU.
Crc_CalculateCRC8H2F	Grc.h	This service makes a CRC8 calculation with the Polynomial 0x2F on Crc_Length
Csm_MacGenerate	Csm.h	Uses the given data to perform a MAC generation and stores the MAC in the memory location pointed to by the MAC pointer.
Csm_MacVerify	Csm.h	Verifies the given MAC by comparing if the MAC is generated with the given data.
Csm_SignatureGenerate	Csm.h	Uses the given data to perform the signature calculation and stores the signature in the memory location pointed by the result pointer.

API Function	Header File	Description
Csm_SignatureVerify	Csm.h	Verifies the given MAC by comparing if the signature is generated with the given data.
Det_ReportError	Det.h	Service to report development errors.
Det_ReportRuntimeError	Det.h	Service to report runtime errors. If a callout has been configured then this callout shall be called.
IdsM_SetSecurityEventWithContext Data	ldsM.h	This API is the application interface to report security events with context data to the IdsM.
StbM_BusSetGlobalTime	StbM.h	Allows the Time Base Provider Modules to forward the Rx Time Tuple to the StbM.
StbM_CanSetMasterTimingData (draft)	StbM_CanTSyn.h	Provides CAN Timesyn module specific data for a Time Master to the StbM.
		Tags: atp.Status=draft
StbM_CanSetSlaveTimingData (draft)	StbM_CanTSyn.h	Allows the CanTSyn Module to forward CAN specific details to the StbM.
		Tags: atp.Status=draft
StbM_GetCurrentTime	StbM.h	Returns a time value (Local Time Base derived from Global Time Base) in standard format.
		Note: This API shall be called with locked interrupts / within an Exclusive Area to prevent interruption (i.e., the risk that the time stamp is outdated on return of the function call).
StbM_GetOffset	StbM.h	Allows the Timesync Modules to get the current Offset Time and User Data.
StbM_GetRxFreshness (draft)	StbM.h	This interface is used by the StbM to query the current freshness value.
		Tags: atp.Status=draft
StbM_GetTimeBaseStatus	StbM.h	Returns detailed status information for a Synchronized (or Pure Local) Time Base and, if called for an Offset Time Base, for the Offset Time Base and the underlying Synchronized Time Base.
StbM_GetTimeBaseUpdateCounter	StbM.h	Allows the Timesync Modules to detect, whether a Time Base should be transmitted immediately in the subsequent <bus>TSyn_MainFunction() cycle.</bus>
StbM_GetTxFreshness (draft)	StbM.h	This API returns the freshness value from the Most Significant Bits in the first byte, of the Freshness array, in big endian format.
		Tags: atp.Status=draft
StbM_GetTxFreshnessTruncData (draft)	StbM.h	This interface is used by the StbM to obtain the current freshness value. The interface function provides also the truncated freshness transmitted in the secured PDU.
		Tags: atp.Status=draft
StbM_SPduTxConfirmation (draft)	StbM.h	This interface is used by the StbM to indicate that the Secured Time Synchronization Message has been initiated for transmission.
		Tags: atp.Status=draft

## 10 Configuration specification

In general, this chapter defines configuration parameters and their clustering into containers. In order to support the specification Chapter 10.1 describes fundamentals. It also specifies a template (table) you shall use for the parameter specification. We intend to leave Chapter 10.1 in the specification to guarantee comprehension.

Chapter 10.2 specifies the structure (containers) and the parameters of the module CanTSyn.

Chapter 10.4 specifies published information of the module Cantsyn.

## 10.1 How to read this chapter

For details refer to the chapter 10.1 "Introduction to configuration specification" in [3].

## 10.2 Containers and configuration parameters

The following chapters summarize all configuration parameters. The detailed meanings of the parameters describe Chapter 7 and Chapter 8.

#### 10.2.1 Variants

[SWS\_CanTSyn\_00108] [The Time Synchronization over CAN shall support the configuration for Time Master, Time Slave and Time Gateway. | (RS\_TS\_20038)

The module supports different post-build variants (previously known as post-build selectable configuration sets), but not post-build loadable configuration.

#### 10.2.2 CanTSyn

SWS Item	[ECUC_CanTSyn_00001]
Module Name	CanTSyn
Description	Configuration of the Synchronized Time-base Manager (StbM) module with respect to global time handling on CAN.
Post-Build Variant Support	true
Supported Config Variants	VARIANT-PRE-COMPILE

Included Containers			
Container Name Multiplicity Scope / Dependency			
CanTSynGeneral	1	This container holds the general parameters of the CAN-specific Synchronized Time-base Manager	
CanTSynGlobalTimeDomain	1*	This represents the existence of a global time domain on CAN.  The CanTSyn module can administrate several global time domains at the same time that in itself form a hierarchy of domains and sub-domains.	
		If the CanTSyn exists it is assumed that at least one global time domain exists.	

# 10.2.3 CanTSynGeneral

SWS Item	[ECUC_CanTSyn_00003]
Container Name	CanTSynGeneral
Parent Container	CanTSyn
Description	This container holds the general parameters of the CAN-specific Synchronized Time-base Manager
Configuration Parameters	

SWS Item	[ECUC_CanTSyn_00002]			
Parameter Name	CanTSynDevErrorDetect	CanTSynDevErrorDetect		
Parent Container	CanTSynGeneral			
Description	Switches the development error det	ection an	d notification on or off.	
	true: detection and notificat	ion is ena	abled.	
	false: detection and notification	tion is di	sabled.	
Multiplicity	1	1		
Туре	EcucBooleanParamDef			
Default value	false			
Post-Build Variant Value	false			
Value Configuration Class	Pre-compile time X All Variants			
	Link time –

SWS Item	[ECUC_CanTSyn_00082]			
Parameter Name	CanTSynlcvVerificationAttempts			
Parent Container	CanTSynGlobalTimeRxIcvVerification	on		
Description	This parameter specifies the number of ICV verification attempts that are to be carried out when the verification of the ICV failed for a given FUP message. If zero is set, then only one ICV verification attempt is done.

#### 10.3 Constraints

[SWS\_CanTSyn\_CONSTR\_00001]{DRAFT} [If the CSM job used to generate ICV is configured in synchronous behaviour, the CanTSynIcvGenerationTimeout shall be set to 0.|(RS TS 20073)

## 10.4 Published Information

For details, refer to the chapter 10.3 "Published Information" in [3].

# A Not applicable requirements

[SWS\_CanTSyn\_NA\_00999] [These requirements on Time Synchronization from the RS Time Synchronization [1] are not applicable to CanTSyn, because they refer either to network types other than CAN or to the Time Base Manager module.] (RS\_TS\_00002, RS\_TS\_00005, RS\_TS\_00006, RS\_TS\_00007, RS\_TS\_00008, RS\_TS\_00009, RS\_TS\_00010, RS\_TS\_00011, RS\_TS\_00012, RS\_TS\_00013, RS\_TS\_00014, RS\_TS\_00015, RS\_TS\_00016, RS\_TS\_00017, RS\_TS\_00018, RS\_TS\_00019, RS\_TS\_00021, RS\_TS\_00024, RS\_TS\_00025, RS\_TS\_00026, RS\_TS\_00027, RS\_TS\_00035, RS\_TS\_00030, RS\_TS\_00031, RS\_TS\_00032, RS\_TS\_00033, RS\_TS\_00035, RS\_TS\_00036, RS\_TS\_00037, RS\_TS\_00038, RS\_TS\_20039, RS\_TS\_20040, RS\_TS\_20041, RS\_TS\_20042, RS\_TS\_20043, RS\_TS\_20044, RS\_TS\_20045, RS\_TS\_20046, RS\_TS\_20047, RS\_TS\_20048, RS\_TS\_20051, RS\_TS\_20052, RS\_TS\_20053, RS\_TS\_20054, RS\_TS\_20058, RS\_TS\_20066, RS\_TS\_20069, RS\_TS\_20061, RS\_TS\_20072, RS\_TS\_20074)
