## 1 Introduction and functional overview

This specification specifies the functionality, API and the configuration of the AUTOSAR Basic Software module TTCAN Driver (called "'Ttcan module"' in this document).

The base for this document is ISO 11898-4 [1]. It is assumed that the reader is familiar with this specification. This document will not describe TTCAN functionality again.

The Ttcan module is part of the lowest layer, performs the hardware access and offers a hardware independent API to the upper layer.

The only upper layer that has access to the Ttcan module is the TtcanIf module (see also SRS\_SPAL\_12092).

The Ttcan module is an extension of the Can module so this document shall only provide information and specifications which differ from the CAN stack. Some general information is given for a better understanding.

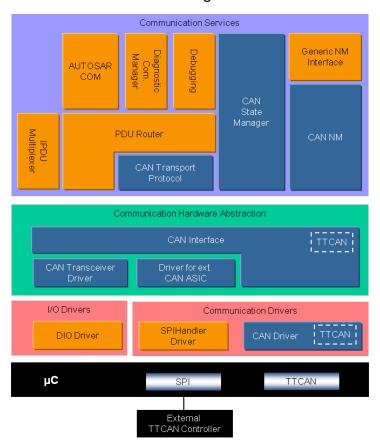

Figure 1.1: AUTOSAR TTCAN Layer Model (see [2])

The Ttcan module provides services for initiating transmissions and calls the callback functions of the TtcanIf module for notifying events, independently from the hardware.

Furthermore, it provides services to control the behavior and state of the TTCAN Controllers that are belonging to the same TTCAN Hardware Unit.

Several TTCAN Controllers can be controlled by a single Ttcan module as long as they belong to the same TTCAN Hardware Unit.

Messages, which are configured for Exclusive Time Windows, will be transmitted periodically with every Tx\_Trigger configured for this message (Continuous Transmission).

Messages, which are configured for Arbitrating Time Windows, will be transmitted only once per transmit request (Single Shot).

# 2 Acronyms and Abbreviations

The glossary below includes acronyms and abbreviations relevant to the TTCAN Driver module that are not included in the [3, AUTOSAR glossary].

Abbreviation / Acronym:	Description:	
Arbitrating Time Window	See ISO 11898-4 [1]	
Basic Cycle	See ISO 11898-4 [1]	
BSW	Basic Software	
Canlf	CAN Interface	
Continuous Transmission	Contrary to Single Shot a message will be transmitted cyclically	
	even without a new transmit request.	
Current Time Master	See ISO 11898-4 [1]	
DLC	Data Length Code (part of L-PDU that describes the SDU length)	
Cycle Time	See ISO 11898-4 [1]	
Exclusive Time Window	See ISO 11898-4 [1]	
Global Time	See ISO 11898-4 [1]	
Hardware Receive Handle	The Hardware Receive Handle (HRH) is defined and provided by	
(HRH)	the TTCAN driver. Typically each HRH represents exactly one	
	hardware object. The HRH can be used to optimize software	
	filtering.	
Inner Priority Inversion	Transmission of a high-priority L-PDU is prevented by the presence	
	of a pending low-priority L-PDU in the same transmit hardware	
	object.	
ISR	Interrupt Service Routine	
L-PDU	Protocol Data Unit for the data link layer (DLL)	
Local Time	See ISO 11898-4 [1]	
Matrix Cycle	See ISO 11898-4 [1]	
MCAL	Microcontroller Abstraction Layer	
NTU	See ISO 11898-4 [1]	
Reference Message	See ISO 11898-4 [1]	
Single Shot	A message will be transmitted only once contrary to Continuous	
	Transmission.	
System Matrix	See ISO 11898-4 [1]	
Time Gap	See ISO 11898-4 [1]	
Time Master	See ISO 11898-4 [1]	
Time Window	See ISO 11898-4 [1]	
Transmission Column	See ISO 11898-4 [1]	
Transmit Trigger Event	See ISO 11898-4 [1]	
TTCAN Controller	A TTCAN Controller serves exactly one physical channel.	
TtcanDrv	CAN Driver module with enabled TTCAN functionality	
Ttcanlf	CAN Interface module with enabled TTCAN functionality	
Tx_Trigger	See ISO 11898-4 [1]	

## 3 Related documentation

All documents of the referenced CAN Driver document [4] are also valid for this document.

# 3.2 Related specification

AUTOSAR provides a General Specification on Basic Software modules [5, SWS BSW General], which is also valid for TTCAN Driver.

Thus, the specification SWS BSW General shall be considered as additional and required specification for TTCAN Driver.

# 4 Constraints and assumptions

The constraints and assumptions of the Ttcan module are the same as for the CAN Driver module [6].

# 5 Dependencies to other modules

This chapter contains brief descriptions of configuration information and services, which are additional required by the TTCAN Driver module from other modules.

The dependencies described in the referenced CAN Driver module [6] also apply for the TTCAN Driver module.

### 5.1 TTCAN Interface

The TTCAN Driver needs additional callback functions provided by the TTCAN Interface (refer to section 8.6).

	not recover from severe error (S3) automatically.	[SWS_TtCan_00122]
		[SWS_TtCan_00123]

# 7 Functional specification

The following section only describes additional TTCAN specific 'Functional specifications'. The Specification of CAN Driver [4] is the base of this TtcanDrv 'extension'.

For a description of the specific functional behaviour of TTCAN refer to the Specification of the TTCAN Interface [7] and the TTCAN ISO Specification [1].

#### 7.1 TTCAN Controller State Machine

An additional state SYNCHRONIZING has to be incorporated between the CAN Controller states STOPPED and STARTED.

#### 7.1.1 TTCAN Controller specific State Description

This chapter corresponds to the chapter "'Can Controller State Machine"' of the CAN Driver SWS [4].

TTCAN Controller state SYNCHRONIZING: The controller has left the state STOPPED and is ready for normal operation. However, in order to participate on the bus, the controller needs to be synchronized to the global bus timing. As long as the controller is not synchronized to the bus, the controller stays in the state SYNCHRONIZING and error frames and acknowledges must not be sent. As soon as the controller is synchronized to the bus, the state of the controller changes from SYNCHRONIZING to STARTED.

For description of the procedure for a controller to become synchronized to the bus refer to [1, ISO 11898-4].

TTCAN Controller states IN\_GAP and IN\_SCHEDULE: During normal operation the controller may switch between IN\_SCHEDULE (normal time-triggered operation) and IN\_GAP (as soon as a gap at the end of the current Basic Cycle is signaled until next Reference Message is sent on the bus to indicate the end of the gap). These state changes do not affect the Ttcan module.

#### 7.1.2 TTCAN Controller specific State Transitions

State transition caused by function Can\_SetControllerMode (CAN\_CS\_STARTED):

[SWS\_TtCan\_00155] [Replaces  $SWS_Can_00262$ : The function <code>Can\_SetControllerMode(CAN\_CS\_STARTED)</code> shall wait for a limited time until the <code>TTCAN Controller</code> has changed to the state <code>SYNCHRONIZING</code> (Compare to  $SWS_Can_00371$ ).]()

Rational for [SWS\_TtCan\_00155]: The controller will switch to the state SYNCHRONIS-ING and will try to become synchronized to the bus. The procedure of synchronizing the controller to the bus might be significantly longer than CanTimeoutTime. Therefore, only the change to the state SYNCHRONIZING shall be observed by the function Can\_SetControllerMode (compare to SWS\_Can\_00371) and the function Can\_-Mainfunction\_Timeout (compare to SWS\_Can\_00372).

State Transition caused by Severe Error (triggered by state change of TTCAN Controller)

## [SWS\_TtCan\_00120] [

- STARTED -> STOPPED
- Triggered by hardware if the TTCAN Controller reaches error level S3 (see TTCAN ISO Specification [1])
- The CanIf module is notified with the function CanIf\_TTSevereError after STOPPED state is reached.

(SRS\_TtCan\_41008)

[SWS\_TtCan\_00121] [After severe error detection, the TTCAN Controller shall transition to the state STOPPED and the Ttcan Driver module shall ensure that the CAN Controller doesn't participate on the network anymore. | (SRS\_TtCan\_41009)

[SWS\_TtCan\_00122] [After severe error detection, TtcanDrv shall cancel still pending messages without raising a cancellation notification.] (SRS TtCan 41009)

[SWS\_TtCan\_00123] [TtcanDrv shall disable or suppress automatic severe error recovery.|(SRS\_TtCan\_41009)

#### 7.2 L-PDU Transmission

Due to the time-triggered schedule, the L-PDU transmission is scheduled according to the Matrix Cycle configured during initialization, i.e. a call of the function Can\_-Write() does not directly trigger an immediate transmission but rather stores the L-PDU in the corresponding HW object, which is scheduled for transmission in a specific Time Window.

**[SWS\_TtCan\_00156]** [It shall be possible to map all transmit message objects to specific Time Windows (see TTCAN ISO Specification [1]) by configuration (see TTCANIF145\_Conf, TTCANIF146\_Conf, TTCANIF147\_Conf, TTCANIF148\_Conf).] (SRS TtCan 41003)

## 7.2.1 Priority Inversion

[SWS\_TtCan\_00154] [Multiplexed transmission and transmit cancellation described in the Specification of CAN Driver [4] shall only be used in Arbitrating Time Windows.]()

Note: In TTCAN communication priority inversion can only happen in Arbitration Time Windows, because the L-PDU with its corresponding CAN ID, which has to be available in a HW object is fixed for Exclusive Time Windows.

# 7.3 L-PDU Reception

The verification of the message reception is controlled by the HW using the configured trigger for reception CAN\_TT\_RX\_TRIGGER (see ECUC\_Can\_00145).

A detailed description of reception triggering and the verification of message reception can be found in [1, ISO 11898-4].

Configuration hint: To suppress regular notifications of consecutive received messages, which maybe needed not that frequently as they arrive, the notifications can be switched-off. In this case the polling via "'Read received data"' and API CanIf\_-ReadRxPduData(), can be used to get the data from CanIf, when it is needed.

# 7.4 Synchronization

Since TTCAN supports time-triggered communication, TtcanDrv needs to support maintaining the timing parameters and the master-controlled synchronization mechanisms.

[SWS\_TtCan\_00004] [TtcanDrv shall provide information from the TTCAN Controller about the timing parameters (see [SWS\_TtCan\_00090]), the synchronization state and the master state (see [SWS\_TtCan\_00091]).|(SRS\_TtCan\_41005)

[SWS\_TtCan\_00005] [TtcanDrv shall provide means to influence the timing parameters of a TTCAN Controller (see [SWS\_TtCan\_00096], [SWS\_TtCan\_00097], [SWS\_TtCan\_00098], [SWS\_TtCan\_00099]) during runtime, if the TTCAN Controller acts as Time Master.|(SRS TtCan\_41005)

[SWS\_TtCan\_00006] [TtcanDrv shall provide the functionality of a timer, which is based on the time marks of the communication system, provided by the TTCAN Controller.|(SRS TtCan 41005)

## 7.4.1 Event Synchronization

[SWS\_TtCan\_00007] [TtcanDrv shall support event-synchronized communication (see [SWS\_TtCan\_00094], [SWS\_TtCan\_00095]) (refer to [1, ISO 11898-4]).] (SRS\_-TtCan\_41006)

# 7.5 Time-Triggered Operation

The events listed below are related to the time-triggered operation of a TTCAN system.

[SWS\_TtCan\_00009] [The events according to Table 7.1 shall be indicated to the application via TtcanIf.](SRS\_TtCan\_41007)

Event	Description	Ttcanlf Function*
Application	The application has not served the	TtcanIf_ApplWatchdogError
Watchdog	application watchdog in time.	
Change of error	The error level of the TTCAN	TtcanIf_TimingError
level	Controller changes between the	
	states S0 - S3	
Tx overflow	More Tx triggers than expected	TtcanIf_TimingError
Tx underflow	Less Tx triggers than expected	TtcanIf_TimingError
Global time error	Synchronization failed	TtcanIf_TimingError
Watch trigger	Watch trigger occurs	TtcanIf_TimingError
Initialization watch	Init_watch_trigger is reached	TtcanIf_TimingError
trigger		
Gap	"'Next is Gap"' bit is set	TtcanIf_Gap
Start of Cycle	Start of a Basic Cycle (including the	TtcanIf_StartOfCycle
	cycle count value).	
Time discontinuity	"'Disc Bit"' is set	TtcanIf_TimeDisc
Master state	Change of the master state between	TtcanIf_MasterStateChange
change	potential and current Time Master	

Table 7.1: Events indicated to application via TtcanIf

# 7.6 Application Watchdog

Note: The TTCAN Application Watchdog shall be served by using a Watchdog Driver instance (see [8, Wachtdog Driver SWS]). The Watchdog Driver instance shall serve the TTCAN Application Watchdog regularly before the timeout is reached.

Note: The timeout is the maximum time period between two consecutive calls to serve the TTCAN Application Watchdog.

Note: The Application Watchdog timeout limit shall be configured by CantTControllerApplWatchdogLimit (see *ECUC\_Can\_00139*).

<sup>\*</sup> to be called in interrupt context (refer to subsection 8.6.1)

# 7.7 TTCAN error handling

This chapter corresponds to the chapter "'Error handling"' of the CAN Driver SWS [4].

[SWS\_TtCan\_00124] [Either the function <code>Can\_TTMainFunction\_IRQ()</code> or an interrupt shall call the function <code>CanIf\_TTTimingError()</code> with the corresponding event type, when error levels <code>S1</code> or <code>S2</code> (see TTCAN ISO Specification [1]) are reached.] (SRS\_TtCan\_41007)

[SWS\_TtCan\_00126] [Either the function <code>Can\_TTMainFunction\_IRQ()</code> or an interrupt shall call the function <code>CanIf\_TTSevereError()</code> with the corresponding event type, when error level <code>S3</code> (see TTCAN ISO Specification [1]) is reached. [SRS\_TtCan\_41007, SRS\_TtCan\_41008)

#### 7.8 Error Classification

#### 7.8.1 Development Errors

## [SWS\_TtCan\_00010] [

Type of error	Related error code	Error value
TTCAN Controller is not a potential time master	CAN_TT_E_NOT_MASTER	0x08
TTCAN Controller is not a current time master	CAN_TT_E_NOT_CURRENT_MASTER	0x09
TTCAN Controller transmits two consecutive reference messages which both have the "'Disc_bit"' set	CAN_TT_E_CONSEQUTIVE_DISC	0x0a
Adjustment of global time fails, because external synchronization has been disabled during configuration	CAN_TT_E_SYNC_DISABLED	0x0b

(SRS\_BSW\_00337)

#### 7.8.2 Runtime Errors

There are no runtime errors.

#### 7.8.3 Transient Faults

There are no transient faults.

#### 7.8.4 Production Errors

There are no production errors.

## 7.8.5 Extended Production Errors

There are no extended production errors.

# 8 API specification

Since the Ttcan module is an extension of the CAN Driver module [4], only specifications which differ from the CAN stack and which are TTCAN specific shall be provided within this chapter.

# 8.1 Imported types

Additional TTCAN specific imported types

# 8.3 Function definitions

Additional TTCAN specific function definitions

# 8.3.1 Can\_TTGetControllerTime

# [SWS\_TtCan\_00090] [

Service Name	Can_TTGetControllerTime		
Syntax	void Can_TTGetControllerTime (    uint8 Controller,    Can_TTTimeType* Can_TTGlobalTime,    Can_TTTimeType* Can_TTLocalTime,    Can_TTTimeType* Can_TTCycleTime,    uint8* Can_TTCycleCount )		
Service ID [hex]	0x33		
Sync/Async	Synchronous		
Reentrancy	Non Reentrant		
Parameters (in)	Controller Controller from which the time information shall be retrieved		
Parameters (inout)	None		
Parameters (out)	Can_TTGlobalTime Address to store return value: Global time		
	Can_TTLocalTime Address to store return value: Local time		
	Can_TTCycleTime Address to store return value: Cycle time		
	Can_TTCycleCount Address to store return value: Cycle count value		
Return value	None		
Description	Gets the current values for the global, local and cycle time and the cycle count of the controller		
Available via	Ttcan.h		

10

[SWS\_TtCan\_00012] [If development error detection for the <code>Ttcan module</code> is enabled: The function <code>Can\_TTGetControllerTime()</code> shall raise the error <code>CAN\_E\_-UNINIT</code> if the driver is not yet initialized. |()

[SWS\_TtCan\_00013] [If development error detection for the Ttcan module is enabled: The function Can\_TTGetControllerTime() shall raise the error CAN\_E\_-PARAM\_CONTROLLER if the parameter Controller is out of range.]()

[SWS\_TtCan\_00014] [If development error detection for the Ttcan module is enabled: The function Can\_TTGetControllerTime() shall raise the error CAN\_E\_-PARAM\_POINTER and shall return E\_NOT\_OK if the parameter Can\_TTGlobalTime or the parameter Can\_TTCycleTime or the parameter Can\_TTCycleTime or the parameter Can\_TTCycleCount is a NULL pointer. | ()

#### 8.3.2 Can TTGetMasterState

## [SWS\_TtCan\_00091] [

Service Name	Can_TTGetMasterState		
Syntax	<pre>void Can_TTGetMasterState (    uint8 Controller,    Can_TTMasterStateType* Can_TTMasterState )</pre>		
Service ID [hex]	0x34		
Sync/Async	Synchronous		
Reentrancy	Non Reentrant		
Parameters (in)	Controller Controller from which the master state shall be retrieved		
Parameters (inout)	None		
Parameters (out)	Can_TTMasterState Address to store return value: Master state		
Return value	None		
Description	Gets the master state. The master state includes the sync mode (sync_off, synchronizing, in_gap, in_schedule) the master-slave mode (master_off, slave, backup_master, current_master) and the current value for ref trigger offset.		
Available via	Ttcan.h		

#### (SRS TtCan 41005)

[SWS\_TtCan\_00016] [If development error detection for the <code>Ttcan module</code> is enabled: The function <code>Can\_TTGetMasterState()</code> shall raise the error <code>CAN\_E\_UNINIT</code> if the driver is not yet initialized. | ()

[SWS\_TtCan\_00017] [If development error detection for the  $Ttcan\ module$  is enabled: The function  $Can_TTGetMasterState()$  shall raise the error  $CAN_E_-$  PARAM\_CONTROLLER if the parameter Controller is out of range.]()

[SWS\_TtCan\_00018] [If development error detection for the Ttcan module is enabled: The function Can\_TTGetMasterState() shall raise the error CAN\_E\_-PARAM\_POINTER and shall return E\_NOT\_OK if the parameter Can\_TTMasterState is a NULL pointer.]()

### 8.3.3 Can\_TTGetNTUActual

## [SWS\_TtCan\_00092] [

Service Name	Can_TTGetNTUActual	
Syntax	<pre>void Can_TTGetNTUActual (    uint8 Controller,    Can_TTTURType* Can_TTTURAct )</pre>	
Service ID [hex]	0x35	
Sync/Async	Synchronous	
Reentrancy	Non Reentrant	
Parameters (in)	Controller Controller from which the NTU vale shall be retrieved	
Parameters (inout)	None	
Parameters (out)	Can_TTTURAct Address to store return value: Actual value of NTU. Value is given in microseconds.	
Return value	None	
Description	Gets the actual value of NTU (network time unit). Together with the local oscillator period, the actual value of NTU can be derived from the actual value of TUR.	
Available via	Ttcan.h	

## (SRS\_TtCan\_41005)

[SWS\_TtCan\_00020] [If development error detection for the <code>Ttcan module</code> is enabled: The function <code>Can\_TTGetNTUActual()</code> shall raise the error <code>CAN\_E\_UNINIT</code> if the driver is not yet initialized.]()

[SWS\_TtCan\_00021] [If development error detection for the Ttcan module is enabled: The function Can\_TTGetNTUActual() shall raise the error CAN\_E\_PARAM\_- CONTROLLER if the parameter Controller is out of range.]()

[SWS\_TtCan\_00022] [If development error detection for the <code>Ttcan module</code> is enabled: The function <code>Can\_TTGetNTUActual()</code> shall raise the error <code>CAN\_E\_PARAM\_-POINTER</code> and shall return <code>E\_NOT\_OK</code> if the parameter <code>Can\_TTNTUAct</code> is a <code>NULL pointer.]()</code>

#### 8.3.4 Can\_TTGetErrorLevel

## [SWS\_TtCan\_00093]

Service Name	Can_TTGetErrorLevel	
Syntax	<pre>void Can_TTGetErrorLevel (    uint8 Controller,    Can_TTErrorLevelType* Can_TTErrorLevel )</pre>	
Service ID [hex]	0x36	
Sync/Async	Synchronous	
Reentrancy	Non Reentrant	
Parameters (in)	Controller	Controller from which the error level shall be retrieved

#### $\triangle$

Parameters (inout)	None	
Parameters (out)	Can_TTErrorLevel Address to store return value: Error level	
Return value	None	
Description	Gets the error level. This includes the severity of the error level (S0-S3) and the minimum and maximum value of the message status count.	
Available via	Ttcan.h	

#### (SRS\_TtCan\_41005)

[SWS\_TtCan\_00024] [If development error detection for the <code>Ttcan module</code> is enabled: The function <code>Can\_TTGetErrorLevel()</code> shall raise the error <code>CAN\_E\_UNINIT</code> if the driver is not yet initialized. |()

[SWS\_TtCan\_00025] [If development error detection for the Ttcan module is enabled: The function Can\_TTGetErrorLevel() shall raise the error CAN\_E\_PARAM\_— CONTROLLER if the parameter Controller is out of range. | ()

[SWS\_TtCan\_00026] [If development error detection for the Ttcan module is enabled: The function Can\_TTGetErrorLevel() shall raise the error CAN\_E\_PARAM\_- POINTER and shall return E\_NOT\_OK if the parameter Can\_TTErrorLevel is a NULL pointer. | ()

#### 8.3.5 Can TTSetNextIsGap

#### [SWS\_TtCan\_00094] [

Service Name	Can_TTSetNextIsGap		
Syntax	<pre>void Can_TTSetNextIsGap (   uint8 Controller )</pre>		
Service ID [hex]	0x37		
Sync/Async	Synchronous		
Reentrancy	Non Reentrant		
Parameters (in)	Controller	Controller Controller for which the "next is gap" indication shall be set.	
Parameters (inout)	None		
Parameters (out)	None		
Return value	None		
Description	Sets the "Next_is_Gap" bit.		
Available via	Ttcan.h		

#### (SRS\_TtCan\_41005, SRS\_TtCan\_41006)

[SWS\_TtCan\_00028] [If development error detection for the <code>Ttcan module</code> is enabled: The function <code>Can\_TTSetNextIsGap()</code> shall raise the error <code>CAN\_E\_UNINIT</code> if the driver is not yet initialized.] ()

[SWS\_TtCan\_00029] [If development error detection for the Ttcan module is enabled: The function Can\_TTSetNextIsGap() shall raise the error CAN\_E\_PARAM\_—CONTROLLER if the parameter Controller is out of range. | ()

## 8.3.6 Can\_TTSetEndOfGap

## [SWS\_TtCan\_00095]

Service Name	Can_TTSetEndOfGap		
Syntax	<pre>void Can_TTSetEndOfGap (    uint8 Controller )</pre>		
Service ID [hex]	0x38		
Sync/Async	Synchronous	Synchronous	
Reentrancy	Non Reentrant		
Parameters (in)	Controller	Controller Controller for which the "set end of gap" indication shall be set	
Parameters (inout)	None		
Parameters (out)	None		
Return value	None		
Description	Signals the end of a gap.		
Available via	Ttcan.h		

#### (SRS TtCan 41005, SRS TtCan 41006)

[SWS\_TtCan\_00031] [The function Can\_TTSetEndOfGap() shall only take effect if the TTCAN Controller is a potentional Time Master.]()

[SWS\_TtCan\_00032] [If development error detection for the Ttcan module is enabled: The function Can\_TTSetEndOfGap() shall raise the error CAN\_TT\_E\_NOT\_-MASTER if the TTCAN Controller is not a potentional Time Master. | ()

[SWS\_TtCan\_00033] [If development error detection for the <code>Ttcan module</code> is enabled: The function <code>Can\_TTSetEndOfGap()</code> shall raise the error <code>CAN\_E\_UNINIT</code> if the driver is not yet initialized.] ()

[SWS\_TtCan\_00034] [If development error detection for the Ttcan module is enabled: The function Can\_TTSetEndOfGap() shall raise the error CAN\_E\_PARAM\_-CONTROLLER if the parameter Controller is out of range. | ()

#### 8.3.7 Can\_TTSetTimeCommand

## [SWS\_TtCan\_00096]

Service Name	Can_TTSetTimeCommand	
Syntax	<pre>void Can_TTSetTimeCommand (    uint8 Controller )</pre>	
Service ID [hex]	0x39	
Sync/Async	Synchronous	
Reentrancy	Non Reentrant	
Parameters (in)	Controller Controller for which the global time shall be adjusted	
Parameters (inout)	None	

_/	1

Parameters (out)	None
Return value	None
Description	Adjusts the global time at the beginning of the next basic cycle by the amount of "global time preset"
Available via	Ttcan.h

#### (SRS TtCan 41005)

[SWS\_TtCan\_00036] [If development error detection for the <code>Ttcan module</code> is enabled: The function <code>Can\_TTSetTimeCommand()</code> shall raise the error <code>CAN\_TT\_E\_-CONSEQUTIVE\_DISC</code> if two consecutive reference messages are transmitted wich both have the "'Disc\_bit" set.] ()

[SWS\_TtCan\_00037] [If development error detection for the Ttcan module is enabled: The function Can\_TTSetTimeCommand() shall raise the error CAN\_TT\_E\_-SYNC\_DISABLED if the adjustment of the Global Time fails, because the external synchronization has been disabled during configuration.]()

[SWS\_TtCan\_00038] [The function Can\_TTSetTimeCommand() shall only take effect if the TTCAN Controller is the current Time Master.]()

[SWS\_TtCan\_00039] [If development error detection for the Ttcan module is enabled: The function Can\_TTSetTimeCommand() shall raise the error CAN\_TT\_E\_-NOT\_CURRENT\_MASTER if the TTCAN Controller is not the current Time Master.]
()

[SWS\_TtCan\_00040] [If development error detection for the Ttcan module is enabled: The function Can\_TTSetTimeCommand() shall raise the error CAN\_E\_UNINIT if the driver is not yet initialized. | ()

[SWS\_TtCan\_00041] [If development error detection for the Ttcan module is enabled: The function Can\_TTSetTimeCommand() shall raise the error CAN\_E\_-PARAM\_CONTROLLER if the parameter Controller is out of range.]()

#### 8.3.8 Can\_TTGlobalTimePreset

### [SWS TtCan 00097] [

Service Name	Can_TTGlobalTimePreset	
Syntax	<pre>void Can_TTGlobalTimePreset (    uint8 Controller,    Can_TTTimeType Can_TTGlobalTimePreset )</pre>	
Service ID [hex]	0x3a	
Sync/Async	Synchronous	
Reentrancy	Non Reentrant	
Parameters (in)	Controller	Controller for which the "global time preset" shall be set

	۸.
/	\

	Can_TTGlobalTime Preset	New value for "global time preset"
Parameters (inout)	None	
Parameters (out)	None	
Return value	None	
Description	Sets the value of "global time preset".	
Available via	Ttcan.h	

### (SRS\_TtCan\_41005)

[SWS\_TtCan\_00043] [If development error detection for the Ttcan module is enabled: The function Can\_TTGlobalTimePreset() shall raise the error CAN\_E\_-UNINIT if the driver is not yet initialized. | ()

[SWS\_TtCan\_00044] [If development error detection for the Ttcan module is enabled: The function Can\_TTGlobalTimePreset() shall raise the error CAN\_E\_-PARAM\_CONTROLLER if the parameter Controller is out of range.]()

## 8.3.9 Can TTSetExtClockSyncCommand

## [SWS\_TtCan\_00098] [

Service Name	Can_TTSetExtClockSyncC	Can_TTSetExtClockSyncCommand	
Syntax	void Can_TTSetExtClo uint8 Controller )	<pre>void Can_TTSetExtClockSyncCommand (    uint8 Controller )</pre>	
Service ID [hex]	0x3b	0x3b	
Sync/Async	Synchronous	Synchronous	
Reentrancy	Non Reentrant	Non Reentrant	
Parameters (in)	Controller	Controller Controller for which the NTU shall be adjusted.	
Parameters (inout)	None	None	
Parameters (out)	None	None	
Return value	None	None	
Description		Adjusts the NTU (network time unit) according to the value given by "NTU adjust". Together with the local oscillator period, "TUR adjust" can be derived from "NTU adjust".	
Available via	Ttcan.h		

#### |(SRS\_TtCan\_41005)

[SWS\_TtCan\_00046] [The function Can\_TTSetExtClockSyncCommand() shall only take effect if the TTCAN Controller is the current Time Master.]()

[SWS\_TtCan\_00047] [If development error detection for the Ttcan module is enabled: The function Can\_TTSetExtClockSyncCommand() shall raise the error CAN\_TT\_E\_NOT\_CURRENT\_MASTER if the TTCAN Controller is not the current Time Master. | ()

[SWS\_TtCan\_00048] [If development error detection for the Ttcan module is enabled: The function Can\_TTSetExtClockSyncCommand() shall raise the error CAN\_E\_UNINIT if the driver is not yet initialized.]()

[SWS\_TtCan\_00049] [If development error detection for the Ttcan module is enabled: The function Can\_TTSetExtClockSyncCommand() shall raise the error CAN\_E\_PARAM\_CONTROLLER if the parameter Controller is out of range. | ()

## 8.3.10 Can\_TTSetNTUAdjust

## [SWS TtCan 00099] [

Service Name	Can_TTSetNTUAdjust	Can_TTSetNTUAdjust	
Syntax	uint8 Controller,	void Can_TTSetNTUAdjust (     uint8 Controller,     Can_TTTURType Can_TTTURAdjust )	
Service ID [hex]	0x3c		
Sync/Async	Synchronous	Synchronous	
Reentrancy	Non Reentrant		
Parameters (in)	Controller	Controller Controller for which the "NTU adjust" shall be set	
	Can_TTTURAdjust	Can_TTTURAdjust New value for "NTU adjust" Value is given in microseconds.	
Parameters (inout)	None	None	
Parameters (out)	None	None	
Return value	None		
Description	Sets the value of "NTU adjust". Together with the local oscillator period, "TUR adjust" can be derived from "NTU adjust".		
Available via	Ttcan.h		

#### (SRS TtCan 41005)

[SWS\_TtCan\_00051] [If development error detection for the  $Ttcan\ module$  is enabled: The function  $Can_TTSetNTUAdjust()$  shall raise the error  $CAN_E_UNINIT$  if the driver is not yet initialized. |()

[SWS\_TtCan\_00052] [If development error detection for the Ttcan module is enabled: The function Can\_TTSetNTUAdjust() shall raise the error CAN\_E\_PARAM\_— CONTROLLER if the parameter Controller is out of range. | ()

# 8.4 Optional Function definitions

Additional optional TTCAN specific function definitions

## 8.4.1 Can\_TTGetSyncQuality

## [SWS\_TtCan\_00101] [

Service Name	Can_TTGetSyncQuality		
Syntax	<pre>void Can_TTGetSyncQuality (    uint8 Controller,   boolean* Can_TTClockSpeed,   boolean* Can_TTGlobalTimePhase )</pre>		
Service ID [hex]	0x47		
Sync/Async	Synchronous		
Reentrancy	Non Reentrant		
Parameters (in)	Controller	Controller Controller from which the sync quality shall be retrieved	
Parameters (inout)	None		
Parameters (out)	Can_TTClockSpeed	Address to store return value: True if the synchronization deviation is smaller than the "Synchronization deviation limit"	
	Can_TTGlobalTimePhase Address to store return value: True if the global time is in phase with the time master.		
Return value	None		
Description	Gets the synchronization quality.		
Available via	Ttcan.h		

## ](SRS\_TtCan\_41005)

[SWS\_TtCan\_00057] [If development error detection for the <code>Ttcan module</code> is enabled: The function <code>Can\_TTGetSyncQuality()</code> shall raise the error <code>CAN\_E\_UNINIT</code> if the driver is not yet initialized. | ()

[SWS\_TtCan\_00058] [If development error detection for the Ttcan module is enabled: The function Can\_TTGetSyncQuality() shall raise the error CAN\_E\_-PARAM\_CONTROLLER if the parameter Controller is out of range.]()

[SWS\_TtCan\_00059] [If development error detection for the Ttcan module is enabled: The function Can\_TTGetSyncQuality() shall raise the error CAN\_E\_-PARAM\_POINTER and shall return E\_NOT\_OK if the parameter Can\_TTClockSpeed or the parameter Can\_TTGlobalTimePhase is a NULL pointer.]()

## 8.4.2 Can\_TTSetTimeMark

#### [SWS\_TtCan\_00102]

Service Name	Can_TTSetTimeMark
Syntax	<pre>void Can_TTSetTimeMark (    uint8 Controller,    Can_TTTimeType Can_TTTimeMark,    Can_TTTimeSourceType Can_TTTimeSource )</pre>
Service ID [hex]	0x48

- /	١.
/	\
$\angle$	_

Sync/Async	Synchronous		
Reentrancy	Non Reentrant	Non Reentrant	
Parameters (in)	Controller Controller for which the time mark shall be set		
	Can_TTTimeMark	Gives the value of the time mark to be set.	
	Can_TTTimeSource	Defines the time source for the time mark to be set.	
Parameters (inout)	None		
Parameters (out)	None		
Return value	None		
Description	Sets a new value for the time mark for the given time source.		
Available via	Ttcan.h		

## (SRS\_TtCan\_41005)

[SWS\_TtCan\_00061] [If development error detection for the <code>Ttcan module</code> is enabled: The function <code>Can\_TTSetTimeMark()</code> shall raise the error <code>CAN\_E\_UNINIT</code> if the driver is not yet initialized. |()

[SWS\_TtCan\_00062] [If development error detection for the Ttcan module is enabled: The function Can\_TTSetTimeMark() shall raise the error CAN\_E\_PARAM\_— CONTROLLER if the parameter Controller is out of range. |()

## 8.4.3 Can\_TTCancelTimeMark

### [SWS\_TtCan\_00103]

Service Name	Can_TTCancelTimeMark	
Syntax	void Can_TTCancelTime uint8 Controller )	eMark (
Service ID [hex]	0x49	
Sync/Async	Synchronous	
Reentrancy	Non Reentrant	
Parameters (in)	Controller	Controller for which the time mark shall be cancelled.
Parameters (inout)	None	
Parameters (out)	None	
Return value	None	
Description	Cancels the time mark.	
Available via	Ttcan.h	

#### (SRS TtCan 41005)

[SWS\_TtCan\_00064] [If development error detection for the Ttcan module is enabled: The function Can\_TTCancelTimeMark() shall raise the error CAN\_E\_UNINIT if the driver is not yet initialized. | ()

[SWS\_TtCan\_00065] [If development error detection for the Ttcan module is enabled: The function Can\_TTCancelTimeMark() shall raise the error CAN\_E\_-PARAM\_CONTROLLER if the parameter Controller is out of range.]()

## 8.4.4 Can\_TTAckTimeMark

## [SWS\_TtCan\_00104] [

Service Name	Can_TTAckTimeMark		
Syntax	<pre>void Can_TTAckTimeMark (    uint8 Controller )</pre>		
Service ID [hex]	0x4a	0x4a	
Sync/Async	Synchronous		
Reentrancy	Non Reentrant		
Parameters (in)	Controller	Controller for which the time mark shall be acknowledged.	
Parameters (inout)	None		
Parameters (out)	None		
Return value	None		
Description	Acknowledges the time mark interrupt by resetting the flag in the interrupt vector register.		
Available via	Ttcan.h		

#### (SRS\_TtCan\_41005)

[SWS\_TtCan\_00067] [If development error detection for the <code>Ttcan module</code> is enabled: The function <code>Can\_TTAckTimeMark()</code> shall raise the error <code>CAN\_E\_UNINIT</code> if the driver is not yet initialized. |()

[SWS\_TtCan\_00068] [If development error detection for the Ttcan module is enabled: The function Can\_TTAckTimeMark() shall raise the error CAN\_E\_PARAM\_-CONTROLLER if the parameter Controller is out of range. |()

## 8.4.5 Can\_TTEnableTimeMarkIRQ

## [SWS\_TtCan\_00105] [

Service Name	Can_TTEnableTimeMarkIR	Can_TTEnableTimeMarkIRQ	
Syntax	void Can_TTEnableTim uint8 Controller )	<pre>void Can_TTEnableTimeMarkIRQ (    uint8 Controller )</pre>	
Service ID [hex]	0x4b	0x4b	
Sync/Async	Synchronous	Synchronous	
Reentrancy	Non Reentrant	Non Reentrant	
Parameters (in)	Controller	Controller Controller for which the time mark interrupt shall be enabled.	
Parameters (inout)	None	None	
Parameters (out)	None	None	
Return value	None	None	
Description	Enables the time mark inter	Enables the time mark interrupt.	
Available via	Ttcan.h	Ttcan.h	

(SRS TtCan 41005)

[SWS\_TtCan\_00070] [If development error detection for the <code>Ttcan module</code> is enabled: The function <code>Can\_TTEnableTimeMarkIRQ()</code> shall raise the error <code>CAN\_E\_-UNINIT</code> if the driver is not yet initialized. |()

[SWS\_TtCan\_00071] [If development error detection for the Ttcan module is enabled: The function Can\_TTEnableTimeMarkIRQ() shall raise the error CAN\_E\_-PARAM\_CONTROLLER if the parameter Controller is out of range.]()

### 8.4.6 Can\_TTDisableTimeMarkIRQ

## [SWS\_TtCan\_00106]

Service Name	Can_TTDisableTimeMarkIF	RQ	
Syntax	void Can_TTDisableTi uint8 Controller )	void Can_TTDisableTimeMarkIRQ (     uint8 Controller )	
Service ID [hex]	0x4c	0x4c	
Sync/Async	Synchronous	Synchronous	
Reentrancy	Non Reentrant	Non Reentrant	
Parameters (in)	Controller	Controller Controller for which the time mark interrupt shall be disabled.	
Parameters (inout)	None	None	
Parameters (out)	None	None	
Return value	None	None	
Description	Disables the time mark inte	Disables the time mark interrupt.	
Available via	Ttcan.h	Ttcan.h	

### (SRS TtCan 41005)

[SWS\_TtCan\_00073] [If development error detection for the Ttcan module is enabled: The function Can\_TTDisableTimeMarkIRQ() shall raise the error CAN\_E\_-UNINIT if the driver is not yet initialized. | ()

[SWS\_TtCan\_00074] [If development error detection for the Ttcan module is enabled: The function Can\_TTDisableTimeMarkIRQ() shall raise the error CAN\_E\_-PARAM\_CONTROLLER if the parameter Controller is out of range.]()

#### 8.4.7 Can TTGetTimeMarkIRQStatus

#### [SWS\_TtCan\_00107]

Service Name	Can_TTGetTimeMarkIRQStatus
Syntax	<pre>void Can_TTGetTimeMarkIRQStatus (    uint8 Controller,   boolean* Can_TTIRQStatus )</pre>
Service ID [hex]	0x4d

- /	١.
/	\
$\angle$	_

Sync/Async	Synchronous	
Reentrancy	Non Reentrant	
Parameters (in)	Controller Controller from which the status of the time mark IRQ shall be retrieved.	
Parameters (inout)	None	
Parameters (out)	Can_TTIRQStatus	Address to store return value: True if the timer for the time mark is pending.
Return value	None	
Description	Gets the IRQ status of the time mark.	
Available via	Ttcan.h	

#### (SRS TtCan 41005)

[SWS\_TtCan\_00076] [If development error detection for the <code>Ttcan module</code> is enabled: The function <code>Can\_TTGetTimeMarkIRQStatus()</code> shall raise the error <code>CAN\_-E\_UNINIT</code> if the driver is not yet initialized. |()

[SWS\_TtCan\_00077] [If development error detection for the Ttcan module is enabled: The function Can\_TTGetTimeMarkIRQStatus() shall raise the error CAN\_- E\_PARAM\_CONTROLLER if the parameter Controller is out of range. | ()

[SWS\_TtCan\_00078] [If development error detection for the Ttcan module is enabled: The function Can\_TTGetTimeMarkIRQStatus() shall raise the error CAN\_-E\_PARAM\_POINTER and shall return E\_NOT\_OK if the parameter Can\_TT IRQStatus is a NULL pointer.]()

### 8.4.8 Can\_TTReceive

#### [SWS\_TtCan\_00108]

Service Name	Can_TTReceive	
Syntax	void Can_TTReceive ( uint8 Controller, uint8 Hrh, Can_IdType* CanId, uint8* CanDlc, uint8* CanSduPtr )	
Service ID [hex]	0	
Sync/Async	Synchronous	
Reentrancy	Non Reentrant	
Parameters (in)	Controller	Controller for which data shall be read out
	Hrh	Hardware receive handle of the hardware object, to read the received data from
Parameters (inout)	None	
Parameters (out)	Canld	Address to store return value: Can ID of the received frame
	CanDlc	Address to store return value: Length of the received frame
	CanSduPtr	Address to store return value: SDU of received frame
Return value	None	

 $\triangle$ 

Description	Reads received data from the controller by returning the pointer of the CanID, the DLC and the Data of the message in the requested HRH.	
Available via	Ttcan.h	

10

[SWS\_TtCan\_00110] [If development error detection for the Ttcan module is enabled: The function Can\_TTReceive() shall raise the error CAN\_E\_UNINIT if the driver is not yet initialized. | ()

[SWS\_TtCan\_00111] [If development error detection for the Ttcan module is enabled: The function Can\_TTReceive() shall raise the error CAN\_E\_PARAM\_CONTROLLER if the parameter Controller is out of range. | ()

[SWS\_TtCan\_00112] [If development error detection for the Ttcan module is enabled: The function Can\_TTReceive() shall raise the error CAN\_E\_PARAM\_POINTER and shall return E\_NOT\_OK if one of the parameter CanId, CanDlc or CanSduPtr is a NULL pointer.]()

### 8.5 Scheduled Functions

Additional TTCAN specific scheduled function definitions

#### 8.5.1 Can TTMainFunction IRQ

#### [SWS TtCan 00113] [

Service Name	Can_TTMainFunction_IRQ
Syntax	<pre>void Can_TTMainFunction_IRQ (   void )</pre>
Service ID [hex]	0x50
Description	Polls the interrupt flags specific to TTCAN
Available via	SchM_Ttcan.h

10

Note: The generic items from CAN Driver SWS [4] regarding the main functions apply for Can TTMainFunction IRQ(), too.

# 8.6 Expected interfaces

#### 8.6.1 Mandatory interfaces

Additional TTCAN specific mandatory interfaces

# [SWS\_TtCan\_00082] [

API Function	Header File	Description
Canlf_TTApplWatchdogError	Ttcanlf.h	Reports an application watchdog error.
Canlf_TTGap	Ttcanlf.h	Reports the occurrence of a gap.
CanIf_TTMasterStateChange	Ttcanlf.h	Reports change of the master state between potential and current master.
CanIf_TTSevereError	Ttcanlf.h	Reports one of the following errors:
		<ul> <li>failed to serve appl. watchdog</li> </ul>
		config error
		<ul> <li>watch trigger reached</li> </ul>
CanIf_TTStartOfCycle	Ttcanlf.h	Reports the start of a basic cycle.
CanIf_TTTimeDisc	Ttcanlf.h	Reports a time discontinuity.
CanIf_TTTimingError	Ttcanlf.h	Reports one of the following errors:
		Change of error level
		Tx overflow / underflow
		<ul> <li>Synchronization failed</li> </ul>
		Init watch trigger

# ](SRS\_TtCan\_41008)

Hint: These additional mandatory interfaces for TTCAN shall serve the interrupts that may occur during time triggered operation as described in [1, ISO 11898-4].

# 9 Sequence diagrams

#### 9.1 Interaction between Ttcan and Ttcanlf module

For sequence diagrams see the TTCAN Interface specification [7] and CAN Interface specification [9]. There are described the complete sequences for Transmission, Reception and Error Handling.

## 9.2 Wakeup sequence

For Wakeup sequence diagrams refer to specification of ECU State Manager [10].

## 10 Configuration specification

In general, this chapter defines configuration parameters and their clustering into containers. For general information about the definition of containers and parameters, refer to the [5, chapter 10.1 "Introduction to configuration specification" in SWS BSWGeneral].

section 10.1 specifies the structure (containers) and the parameters of the Ttcan module.

section 10.2 specifies published information of the Ttcan module.

## 10.1 Containers and configuration parameters

Additional TTCAN specific configuration parameters

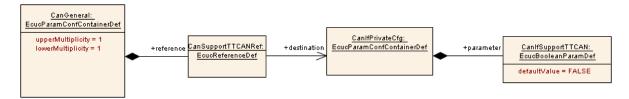

Figure 10.1: CAN Driver Time Triggered General Configuration

The reference CanSupportTTCANRef is described in Specification of CAN Driver [4], SWS Item Id ECUC Can 00430.

**[SWS\_TtCan\_00157]** [The TT Can Driver module shall reject configurations with partition mappings which are not supported by the implementation.] ()

#### 10.1.1 CanTTController

SWS Item	[ECUC_Can_00001]
Container Name	CanTTController
Parent Container	CanController
Description	CanTTController is specified in the SWS TTCAN and contains the configuration parameters of the TTCAN controller(s) (which are needed in addition to the configuration parameters of the CAN controller(s)).
	This container is only included and valid if TTCAN is supported by the controller, enabled (see CanSupportTTCANRef, ECUC_Can_00430), and used.
Configuration Parameters	

SWS Item	[ECUC_Can_00139]			
Parameter Name	CanTTControllerApplWatchdogLim	it		
Parent Container	CanTTController			
Description	Defines the maximum time period ( has to serve the watchdog.	Defines the maximum time period (unit is 256 times NTU) after which the application has to serve the watchdog.		
Multiplicity	1			
Туре	EcucIntegerParamDef			
Range	0 255			
Default value	_			
Post-Build Variant Value	true			
Value Configuration Class	Pre-compile time	X	VARIANT-PRE-COMPILE	
	Link time –			
	Post-build time X VARIANT-POST-BUILD			
Scope / Dependency	scope: ECU			

SWS Item	[ECUC_Can_00138]	[ECUC_Can_00138]		
Parameter Name	CanTTControllerCycleCountMax			
Parent Container	CanTTController			
Description	Defines the value for cycle_count_max. Allowed values: 0x00: 1 basic cycle 0x01: 2 basic cycles 0x03: 4 basic cycles 0x07: 8 basic cycles 0x0F: 16 basic cycles 0x1F: 32 basic cycles 0x3F: 64 basic cycles

	Post-build time X VARIANT-POST-BUILD			
Scope / Dependency	scope: local			
	dependency: CanTTControllerLevel2 (ECUC_Can_00131)			

SWS Item	[ECUC_Can_00131]		
Parameter Name	CanTTControllerLevel2		
Parent Container	CanTTController		
Description	Defines whether Level 2 or Level 1	is used.	TRUE: Level 2. FALSE: Level 1.
	If this parameter is set to FALSE the TTControllerLevel2 need not be controller.		ameters with dependency to Can
Multiplicity	1		
Туре	EcucBooleanParamDef		
Default value	_		
Post-Build Variant Value	true		
Value Configuration Class	Pre-compile time X VARIANT-PRE-COMPILE		
	Link time –		
	Post-build time X VARIANT-POST-BUILD		
Scope / Dependency	scope: local		

SWS Item	[ECUC_Can_00141]		
Parameter Name	CanTTControllerNTUConfig		
Parent Container	CanTTController		
Description	Defines the config value for NTU (network time unit). Value given in microseconds. The value configured shall be greater than 0. Together with the local oscillator period, the TUR (time unit ratio) can be derived from the NTU. This parameter shall only be configurable if parameter CanTTControllerLevel2 equals TRUE.		
Multiplicity	1		
Туре	EcucFloatParamDef		
Range	[0 100]		
Default value	-		
Post-Build Variant Value	true		

Value Configuration Class	Pre-compile time	Х	VARIANT-PRE-COMPILE
	Link time	_	
	Post-build time	Х	VARIANT-POST-BUILD
Scope / Dependency	scope: ECU		
	dependency: CanTTControllerLevel2 (ECUC_Can_00131)		

SWS Item	[ECUC_Can_00127]			
Parameter Name	CanTTControllerOperationMode			
Parent Container	CanTTController			
Description	Defines the operation mode.			
Multiplicity	1			
Туре	EcucEnumerationParamDef			
Range	CAN_TT_EVENT_SYNC_TIME_ Event-synchronized time triggered operation TRIGGERED			
	CAN_TT_EVENT_TRIGGERED Event triggered operation (normal can operation without time schedule)			
	CAN_TT_TIME_TRIGGERED Time triggered operation			
Post-Build Variant Value	true			
Value Configuration Class	Pre-compile time	X VARIANT-PRE-COMPILE		
	Link time	_		
	Post-build time X VARIANT-POST-BUILD			
Scope / Dependency	scope: ECU			

SWS Item	[ECUC_Can_00132]			
Parameter Name	CanTTControllerSyncDeviation	CanTTControllerSyncDeviation		
Parent Container	CanTTController			
Description	Defines the maximum synchronization deviation: Given as a percentage value of the NTU (network time unit). The value configured shall be greater than 0. This parameter shall only be configurable if parameter CanTTControllerLevel2 equals TRUE.			
Multiplicity	1			
Туре	EcucFloatParamDef			
Range	[0 100]			
Default value	-			
Post-Build Variant Value	true			
Value Configuration Class	Pre-compile time	X	VARIANT-PRE-COMPILE	
	Link time –			
	Post-build time X VARIANT-POST-BUILD			
Scope / Dependency	scope: local			
	dependency: CanTTControllerLevel2 (ECUC_Can_00131)			

SWS Item	[ECUC_Can_00129]
Parameter Name	CanTTControllerTimeMaster
Parent Container	CanTTController
Description	Defines whether the controller acts as a potential time master. TRUE: Potential time master. FALSE: Time slave.
Multiplicity	1
Туре	EcucBooleanParamDef
Default value	-

Post-Build Variant Value	true		
Value Configuration Class	Pre-compile time	Х	VARIANT-PRE-COMPILE
	Link time	_	
	Post-build time	Х	VARIANT-POST-BUILD
Scope / Dependency	scope: ECU		

SWS Item	[ECUC_Can_00130]			
Parameter Name	CanTTControllerTimeMasterPriority	,		
Parent Container	CanTTController			
Description	Defines the time master priority.			
Multiplicity	1			
Туре	EcucIntegerParamDef			
Range	0 7	07		
Default value	-			
Post-Build Variant Value	true			
Value Configuration Class	Pre-compile time	Pre-compile time X VARIANT-PRE-COMPILE		
	Link time -			
	Post-build time X VARIANT-POST-BUILD			
Scope / Dependency	scope: ECU			

SWS Item	[ECUC_Can_00133]			
Parameter Name	CanTTControllerTURRestore			
Parent Container	CanTTController			
Description	Enables/disables the TUR restore. Note that the value configured for TUR can be derived from the value configured for NTU and the local oscillator preriod. TRUE: TUR restore enabled. FALSE: TUR restore disabled.			
	This parameter shall only be configurable if parameter CanTTControllerLevel2 equals TRUE.			
Multiplicity	1			
Туре	EcucBooleanParamDef			
Default value	-			
Post-Build Variant Value	true			
Value Configuration Class	Pre-compile time X VARIANT-PRE-COMPILE			
	Link time –			
	Post-build time X VARIANT-POST-BUILD			
Scope / Dependency	scope: local			
	dependency: CanTTControllerLevel2 (ECUC_Can_00131)			

SWS Item	[ECUC_Can_00137]				
Parameter Name	CanTTControllerTxEnableWindowLength			CanTTControllerTxEnableWindowLength	
Parent Container	CanTTController				
Description	Length of the tx enable window given in CAN bit times. Definition parameter "Can TTControllerTxEnableWindowlength" is used such that: Length of enable window = CanTTControllerTxEnableWindowLength + 1				
Multiplicity	1				
Туре	EcucIntegerParamDef				
Range	1 16				
Default value	-				

Post-Build Variant Value	true		
Value Configuration Class	Pre-compile time	Х	VARIANT-PRE-COMPILE
	Link time	_	
	Post-build time	Х	VARIANT-POST-BUILD
Scope / Dependency	scope: ECU	•	

SWS Item	[ECUC_Can_00158]			
Parameter Name	CanTTControllerWatchTriggerGapTimeMark			
Parent Container	CanTTController	CanTTController		
Description	watch trigger time mark after a gap	watch trigger time mark after a gap		
Multiplicity	1			
Туре	EcucIntegerParamDef			
Range	0 65535	0 65535

[SWS\_TtCan\_CONSTR\_00001] [The ECUC partitions referenced by CanttControllerEcucPartitionRef shall be a subset of the ECUC partitions referenced by CanEcucPartitionRef.] ()

[SWS\_TtCan\_CONSTR\_00002] [CanTTController and CanTrovChannel of one communication channel shall all reference the same ECUC partition.] ()

## 10.1.2 CanTTHardwareObjectTrigger

SWS Item	[ECUC_Can_00002]
Container Name	CanTTHardwareObjectTrigger
Parent Container	CanHardwareObject
Description	CanTTHardwareObjectTrigger is specified in the SWS TTCAN and contains the configuration (parameters) of TTCAN triggers for Hardware Objects, which are additional to the configuration (parameters) of CAN Hardware Objects.
	This container is only included and valid if TTCAN is supported by the controller and, enabled (see CanSupportTTCANRef, ECUC_Can_00430), and used.
Configuration Parameters	

SWS Item	[ECUC_Can_00147]		
Parameter Name	CanTTHardwareObjectBaseCycle		
Parent Container	CanTTHardwareObjectTrigger		
Description	Defines the cycle_offset. CanTTHardwareObjectBaseCycle must be not greater than cycle_count_max.		
Multiplicity	1		
Туре	EcucIntegerParamDef		
Range	0 63		
Default value	-		
Post-Build Variant Value	true		
Value Configuration Class	Pre-compile time	X	VARIANT-PRE-COMPILE
	Link time	-	
	Post-build time	X	VARIANT-POST-BUILD
Scope / Dependency	scope: ECU	•	

SWS Item	[ECUC_Can_00148]	[ECUC_Can_00148]		
Parameter Name	CanTTHardwareObjectCycl	CanTTHardwareObjectCycleRepetition		
Parent Container	CanTTHardwareObjectTrigg	CanTTHardwareObjectTrigger		
Description	Defines the repeat_factor.	Defines the repeat_factor.		
		CanTTHardwareObjectCycleRepetition shall be a power of two (2), greater than cycle_offset but not greater than cycle_count_max + 1.		
Multiplicity	1	1		
Туре	EcucIntegerParamDef	EcucIntegerParamDef		
Range	1 64	1 64		
Default value	-	-		
Post-Build Variant Value	true	true		
Value Configuration Class	Pre-compile time	X	VARIANT-PRE-COMPILE	
	Link time	_		
	Post-build time	X	VARIANT-POST-BUILD	
Scope / Dependency	scope: ECU			

SWS Item	[ECUC_Can_00146]
Parameter Name	CanTTHardwareObjectTimeMark
Parent Container	CanTTHardwareObjectTrigger
Description	Defines the point in time, when the trigger will be activated. Value is given in cycle time.
Multiplicity	1

Туре	EcucIntegerParamDef		
Range	0 65535		
Default value	-		
Post-Build Variant Value	true		
Value Configuration Class	Pre-compile time	X	VARIANT-PRE-COMPILE
	Link time	-	
	Post-build time	Х	VARIANT-POST-BUILD
Scope / Dependency	scope: local		

SWS Item	[ECUC_Can_00155]		
Parameter Name	CanTTHardwareObjectTriggerId		
Parent Container	CanTTHardwareObjectTrigger		
Description	Sequential number which allows separation of different TTCAN triggers configured for one and the same hardware object.		
Multiplicity	1		
Туре	EcucIntegerParamDef (Symbolic Name generated for this parameter)		
Range	0 63		
Default value	-		
Post-Build Variant Value	false		
Value Configuration Class	Pre-compile time	Х	All Variants
	Link time	_	
	Post-build time	_	
Scope / Dependency	scope: local		

SWS Item	[ECUC_Can_00145]			
Parameter Name	CanTTHardwareObjectTriggerType			
Parent Container	CanTTHardwareObjectTrigger			
Description	Defines the type of the trigger associated with the hardware object. This parameter depends on plain CAN parameter CAN_OBJECT_TYPE. If CAN_OBJECT_TYPE equals RECEIVE than this parameter is fixed to CAN_TT_RX_TRIGGER. If CAN_OBJECT_TYPE equals TRANSMIT than one of the following literals is configurable: CAN_TT_TX_REF_TRIGGER, CAN_TT_TX_REF_TRIGGER_GAP, CAN_TT_TX_TRIGGER_MERGED, CAN_TT_TX_TRIGGER_SINGLE, CAN_TT_TX_TRIGGER_EXCLUSIVE.			
Multiplicity	1			
Туре	EcucEnumerationParamDef			
Range	CAN_TT_RX_TRIGGER	Trigger for verifying the successful reception of messages.		
	CAN_TT_TX_REF_TRIGGER	Trigger for transmitting the reference message.		
	CAN_TT_TX_REF_TRIGGER_ GAP	Trigger for transmitting the reference message in case no event occurs after a gap.		
	CAN_TT_TX_TRIGGER_ EXCLUSIVE	Trigger for transmitting a message in an exclusive time window.		
		Note, that messages in an exclusive window are transmitted continuously, i.e. regardless whether the same message has been transmitted before, the message, which is currently available, will be transmitted every time the tx trigger occurs.		

	CAN_TT_TX_TRIGGER_ MERGED  CAN_TT_TX_TRIGGER_SINGLE	merged merged TX_TR  Note, the transmithe transmithe transmit the transmit trigger (non-merger Note, the transmithe transmither tr	for transmitting a message in a single erged) arbitration window (or the last tx in a merged arbitration window).  nat messages in an arbitration window are litted only, if new data is available. When as mission was not successful, it will be end at the next tx trigger for this message, the transmission was successful, this ge will not be transmitted again at the next ers until a new message for this tx trigger
Post-Build Variant Value	true		
Value Configuration Class	Pre-compile time	Х	VARIANT-PRE-COMPILE
	Link time	_	
	Post-build time	Х	VARIANT-POST-BUILD
Scope / Dependency	scope: local		
	dependency: CAN_OBJECT_TYPE		

### No Included Containers
