1 Introduction and functional overview

This specification describes the functionality and the configuration of the AUTOSAR Basic Software module Dlt.

It receives log information from DET, DEM, SW-Cs, or trace information of the RTE. The Dlt module transmits this data via communication busses to make this information visible outside the ECU.

For this purpose, the DIt module defines the API to send and receive dedicated log/trace information on the bus.

In addition, the NvM module can be optionally used to store an updated filter setting of the Dlt module persistently. This enables the ECU to transmit log/trace information with the desired level without the need of an explicit setup request coming from the communication bus (via a logging tool) at every ECU startup.

The Dlt module is located on top of the PduR and below the RTE.

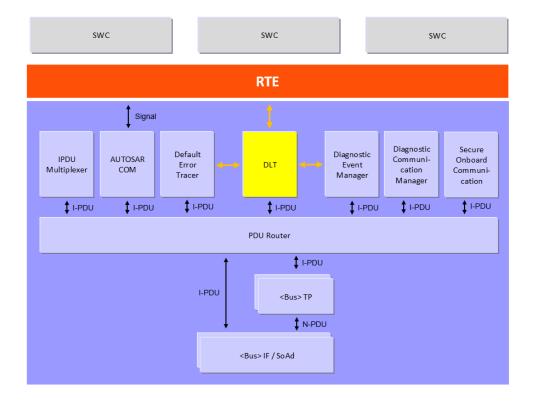

Figure 1 – Location of the Dlt module

Please note:

The Dlt Message Format, the available Dlt Commands, and the Dlt protocol (to communicate with an external logging and tracing tool) are defined in a separate document. Please refer to the Dlt Protocol Specification [1] for further information.

2 Acronyms and abbreviations

Abbreviation / Acronym:	Description:
APID	Application ID
CTID	Context ID
Dlt	Diagnostic Log and Trace
MCNT	Message Counter
MSBF	Most Significant Byte First
MSBI	Message Bus Info
MSCI	Message Control Info
MSLI	Message Log Info
MSTP	Message Type
MSTI	Message Trace Info
NOAR	Number of Arguments
STMS	Timestamp
UEH	Use Extended Header
VERB	Verbose
VERS	Version Number
WEID	With ECU ID
WSID	With Session ID
WTMS	With Timestamp

2.1 Term and definition

Term	Description:
Log and trace message	A log and trace message contains all data and options to describe a log and trace event in a software. A log and trace message consists of a header and payload.
Dlt User	A Dlt User represents the source of a generated Dlt message. The possible users are SW-Cs, RTE (for VFB traces), DEM, or DET.
Log Message	A Log Message contains debug information like state changes or value changes.
Trace Message	A Trace messages contains information, which has passed via the VFB.
ECU ID	ECU IDis the name of an ECU, composed by four 8-bit ASCII characters (e.g., ABS0 or COMB).
Session	A session is a logical entity of source of log or trace messages. If an application / SW-C is instantiated several times, each instance gets a globally unique session ID with respect to the application / context ID. It is possible for an application / SWC to have several simultaneous log or trace sessions, if it has several ports opened to Dlt. Since Session ID is not specified in AUTOSAR for SW-Cs, the port defined argument values shall be used for this number.
Session ID	Session ID is the identification number of a log or trace session.
Application ID	Application ID is an abbreviation of an application / SW-C. It identifies the

Specification of Diagnostic Log and Trace AUTOSAR CP R22-11

	application / SW-C a log and trace message originates from. The Application ID is composed by four 8-bit ASCII characters.	
Context ID	Context ID is a user defined identifier to group Log and Trace Messages generated by an application / SW-C. The following rules apply: • Each ApplicationID can own several Context IDs. • Context IDs are grouped by Application IDs. • Context IDs shall be unique within an Application ID. • The source of a log and trace message is identified using the tuple "ApplicationID" and "ContextId". Four 8-bit ASCII characters compose the ContextId.	
Message ID	Messaged ID is the identifier to characterize the information, which is transported by the message itself. A Message ID identifies a kind of log or trace message uniquely. It can be used for identifying the source (in source code) of a message and it can be used for characterizing the payload of a message. A Message ID is statically fixed at development or configuration time.	
Log level	A log level defines a classification for the severity grade of a Log Message.	
Trace status	The trace status provides information, if a trace message should be send.	
Log Channel	A physical communication bus, which is used to transmit Dlt messages.	
External client	The external client is a tool to control, monitor, and store log / trace messages provided by ECUs using the Dlt module.

3.2 Related standards and norms

IEC 7498-1 The Basic Model, IEC Norm, 1994

3.3 Related specification

AUTOSAR provides a General Specification on Basic Software (SWS BSW General) which is also valid for Dlt.

Thus, the specification SWS BSW General shall be considered as additional required specification for the Dlt module.

4 Constraints and assumptions

4.1 Limitations

VFB Trace only supports the non-verbose mode. I.e., the Dlt module will send out the arguments in a raw format, simply doing a memory copy of the arguments to the trace message.

The Dlt data type model does NOT support arbitrarily nested complex data types, which AUTOSAR does. So there is no generic way to transform arguments given to the VFB Trace hook functions into Dlt data types needed for the verbose mode.

An ASAM Fibex description cannot be generated by the Dlt module as the in-memory representation might not be compliant to the SWCD data type description of the arguments.

4.2 Applicability to car domains

This basic software module can be used for all car domains.

5 Dependencies to other modules

5.1 RTE

The RTE (including the VFB and the BSW Scheduler) is used to interact with SW-Cs to generate Log and Trace messages and to call the Dlt module's Tx function cyclically.

5.2 PDU Router

In order to transmit Dlt messages on the communication bus, the Dlt module interacts with the PDU Router.

5.3 NvM

In order to load and store altered configurations like filter settings and/or Log Channel assignments, the NvM module can optionally be used.

5.4 **GPT**

In order to derive a time stamp, the GPT module can be used for this purpose.

5.5 **StbM**

In order to get a synchronized time value (Local Time Base derived from Global Time Base) in standard/extended format., the StbM module can be used for this purpose.

5.6 **DET**

In order to be able to report default errors and to forward DET errors to the communication bus, the Dlt module has to interact with the DET module. However, the interaction with DET is optional.

5.7 **DEM**

In order to be able to report development errors and to transmit DEM events on the communication bus, the Dlt module has to interact with the DEM module using a CDD and/or a SW-C. No standardized interaction between DEM and DLT is available.

6 Requirements traceability

Requirement	Description	Satisfied by
RS_LT_00003	Applications shall have the possibility to send log or trace messages to the LT module.	SWS_Dlt_00241, SWS_Dlt_00243
RS_LT_00004	The LT shall provide the actual set of log levels and the trace status to an Application.	SWS_Dlt_00252, SWS_Dlt_00254
RS_LT_00006	Trace events from errors generated by BSW and Applications shall be forwarded to the LT module.	SWS_DIt_00430, SWS_DIt_00432
RS_LT_00008	RTE shall provide an interface for LT to trace RTE/VFB calls.	SWS_Dlt_00284
RS_LT_00009	The LT shall implement an interface to trace the RTE/VFB.	SWS_Dlt_00276, SWS_Dlt_00277, SWS_Dlt_00285
RS_LT_00032	A protocol shall be implemented to be able to set and query the trace status and log levels of log and trace sources of each ECU.	SWS_Dlt_00643
RS_LT_00033	A list of all log and trace sources of an ECU shall be accessible from the external client.	SWS_Dlt_00021, SWS_Dlt_00245, SWS_Dlt_00769
RS_LT_00034	LT shall support a generic API for communicating over a LT communication module.	SWS_Dlt_00516
RS_LT_00036	The LT shall provide a buffer for storing log and trace messages before initialization.	SWS_Dlt_00003
RS_LT_00038	A mechanism shall be implemented to be able to set the trace status and log levels of registered Application IDs and context IDs of each Application.	
RS_LT_00039	The LT shall provide the possibility to store configuration data in a persistent way.	SWS_DIt_00078, SWS_DIt_00453
SRS_BSW_00101	The Basic Software Module shall be able to initialize variables and hardware in a separate initialization function	
SRS_BSW_00344	BSW Modules shall support link-time configuration	SWS_DIt_00239
SRS_BSW_00358	The return type of init() functions implemented by AUTOSAR Basic Software Modules shall be void	SWS_Dlt_00239
SRS_BSW_00402	Each module shall provide version information	SWS_DIt_00271
SRS_BSW_00404	BSW Modules shall support post-build configuration	SWS_DIt_00239
SRS_BSW_00405	BSW Modules shall support multiple configuration sets	SWS_Dlt_00239
SRS_BSW_00407	Each BSW module shall provide a function to read out the version information of a dedicated module implementation	SWS_Dlt_00239
SRS_BSW_00414	Init functions shall have a pointer to a configuration structure as single parameter	SWS_DIt_00239, SWS_DIt_00437

7 Functional specification

7.1 Dlt specification

The following chapters describe the AUTOSAR specific data and control paths the Dlt module needs for the interaction with SW-Cs, PduR, and an external client (logging tool).

7.1.1 Dlt commands

The Dlt Protocol specifies all sorts of Dlt Commands which are identified by unique Service IDs. The Dlt Commands are used to modify the behavior of the Dlt module at runtime, e.g., fetching information about the current Dlt configuration or altering filter settings.

[SWS_DIt_00643] [The AUTOSAR Dlt module shall support the following Dlt Commands identified by the following Services IDs:

Service ID	Dlt Command Name	Description
0x01	SetLogLevel	Set the Log Level
0x02	SetTraceStatus	Enable/Disable Trace Messages
0x03	GetLogInfo	Return the LogLevel for registered SW-Cs
0x04	GetDefaultLogLevel	Return the Log Level for wildcards
0x05	StoreConfiguration	Store the current configuration non-volatile
0x06	ResetToFactoryDefault	Set the configuration back to default
0x0A	SetMessageFiltering	Enable/Disable the Dlt filters
0x11	SetDefaultLogLevel	Set the LogLevel for wildcards
0x12	SetDefaultTraceStatus	Enable/Disable Trace Messages for wildcards
0x15	GetDefaultTraceStatus	Get the current TraceLevel for wildcards
0x17	GetLogChannelNames	Return the name(s) of the LogChannel(s)
0x1F	GetTraceStatus	Get the current trace status (on/off)
0x20	SetLogChannelAssignment	Add/ Remove the given LogChannel as output path
0x21	SetLogChannelThreshold	Set the filter threshold for the given LogChannel
0x22	GetLogChannelThreshold	Get the filter threshold for the given LogChannel
0x23	BufferOverflowNotification	Indication of a buffer overflow within the DLT module
0x24	SyncTimeStamp	Reports synchronized absolute time

] (RS_LT_00032)

Note:

The layouts of the defined Dlt Commands, which can be received via Dlt Control Messages, are defined in the Dlt Protocol Specification [1].

7.1.2 Dlt interaction with software components

The Dlt module offers interfaces SW-Cs can use for sending Log and Trace Messages.

Optionally, SW-Cs can provide a port for notifications on log level threshold and trace status changes, which are provided by the Dlt module separately for every tuple of ApplicationId/ContextId. These notifications can be used to avoid already the generation of Log and Trace Messages by the SW-Cs, instead of having them to be filtered out later on by the Dlt module.

Since the Dlt module supports multiple instances of SW-Cs, which use the same tuples of ApplicationId/ContextId, an additional SessionId parameter allows distinguishing log/trace messages from different instances of the same SW-C.

To separate those SW-Cs technically from each other and to avoid that SW-Cs have to use unique <code>SessionIds</code> in calls to <code>SendLogMessage/SendTraceMessage</code> (details, see next chapters), the Dlt module provides a dedicated P-Port per configured SW-C (see configuration parameter <code>DltSwc</code>) where the <code>SessionId</code> is managed as a port-defined-argument.

If a configured SW-C is marked as being interested in notifications on log level and trace state changes, the Dlt module also provides a corresponding R-Port to notify the respective SW-C.

The information, which SW-C is responsible for which <code>ApplicationId/ContextId</code> tuples, is configured for the SW-C and/or updated by the SW-C during runtime with a call to <code>RegisterContext</code> and <code>UnregisterContext</code> respectively.

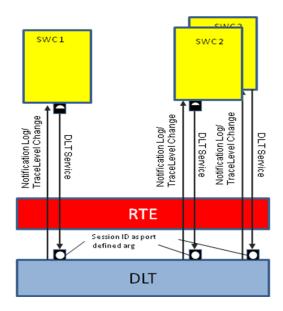

Figure 2 - Interaction with SW-C (Port configuration)

[SWS_DIt_00644] [The DIt module shall provide a P-Port typed by interface DltService (see chapter 8), for each configured SW-C (see configuration container DltSwc).] ()

[SWS_Dlt_00645] [The P-Port typed by interface has SessionId as a port-defined argument. | ()

[SWS_DIt_00646] [The DIt module shall provide an R-Port typed by interface LogTraceSessionControl (see chapter 8), for each configured SW-C (see configuration container DltSwc), where the configuration parameter DltSwcSupportLogLevelAndTraceStatusChangeNotification is set to TRUE.] ()

[SWS_DIt_00647] [The ApplicationId/ContextId tuples for which the SW-C is responsible for and therefore needs to be notified in case of log level or trace state changes shall be deduced from configuration parameter DltSwcContext.] ()

7.1.2.1 Registering ApplicationIDs and ContextIds to Dlt

The Dlt module is able to inform SW-Cs about a log level change. For this purpose, they have to register at the Dlt module, using a tuple of ApplicationId/ContextId at runtime.

Note:

Because the developing of SW-C is not object of this specification, the Dlt module has to collect this information at runtime.

[SWS_DIt_00765] [The DIt module shall remember all tuples of ApplicationIDs and ContextIds of the SW-Cs, which register to the DIt module. | ()

[SWS_DIt_00766] [The Dit module shall manage a log level and a trace state for every tuple of ContextId and ApplicationID.] ()

Note:

In addition, a dynamic registration supports the possibility for the Dlt module to see which SW-C/runnable is active and which not. This is essential to know which SW-C to inform in case of a log level or trace status change.

When a SW-C is calling the <code>Dlt_RegisterContext</code> method of the <code>DLTService</code> interface, a port defined argument value is provided (<code>SessionID</code>) to the <code>Dlt</code> module. The value of this port defined argument corresponds to <code>LogTraceSessionControl</code> interface of the SW-C/runnable for providing information about the changing of a log level to the SW-C/runnable.

[SWS_DIt_00021] [The Dlt module shall remember the relation between the registered tuple of ApplicationId/ContextId, and the port interface where this tuple is registered.] (RS_LT_00033)

[SWS_DIt_00768] [If the parameter

DltGeneralRegisterContextNotification is set to TRUE, every time Dlt_RegisterContext is called, the Dlt module shall send the Dlt Control Message GetLogInfo containing the provided ApplicationId/ContextId.] ()

7.1.2.2 Unregistering ApplicationIDs and ContextIds to Dlt

In case a SW-C is going to be stopped, it should unregister itself. This information can be used to inform an external client (e.g. a logging device) about the current SW-C status.

[SWS_DIt_00773] [The DIt module shall delete all tuples of ApplicationIDs and ContextIds of the SW-Cs which unregister to the DIt module from the list of registered applications.] ()

Note:

For these tuples, the Dlt module will not try to notify the corresponding SWC any more about LogLevel changes.

[SWS Dit 00774] [If the parameter

DltGeneralRegisterContextNotification is set to TRUE, every time Dlt_UnregisterContext is called, the Dlt module shall send the Dlt Control Message GetLogInfo containing the provided ApplicationId/ContextId with parameter "status" set to 5.] ()

7.1.2.3 Using port defined argument values for the definition of SessionIds

For every function call of Dlt_SendLogMessage, Dlt_SendTraceMessage, Dlt_RegisterContext and Dlt_UnregisterContext, a port defined argument value needs to be provided.

[SWS_DIt_00022] [Port defined argument values shall be used by the DIt module as SessionIds.] ()

Note:

A session is the part of a SW-C for which a log level monitor is responsible. For each log level monitor the same SessionId (port defined argument value) shall be used.

[SWS_DIt_00023] [The port defined argument value corresponds to the defined

SessionID. The value shall start at 0x1000 (for BSW modules the module ID is taken).] ()

[SWS_DIt_00332] [Each port of a SW-C connected to the Dlt module shall have a unique SessionId as port defined argument. The range of SessionIds shall be continuous. | ()

7.1.3 VFB trace

The VFB trace is specified in the RTE. The meaning of VFB trace is an implicit (system inherent) forwarding of SW-C communication data (which flows over the RTE) to the Dlt module. Trace means in this case that no explicit call by the SW-C is made to forward this data to Dlt. This section describes the interaction of the RTE with the Dlt module to record a VFB trace and the internal control of the trace data.

7.1.3.1 Interfaces provided by Dlt for VFB traces

In case the Dlt module is used as a VFB trace client, the RTE has to be configured accordingly. This means that the RTE configuration parameter RteVfbTraceClientPrefix has to be configured with value "Dlt".

The configuration, whether VFB tracing is enabled at all and which traceable events are supported/activated, is solely configured in the RTE module.

From its configuration, the RTE generator then updates in Generation Phase the RTEs Basic Software Module Description with <code>BswModuleEntries</code> for each configured VFB trace hook function. Those <code>BswModuleEntries</code> exactly describe the expected function prototype the configured trace clients have to provide:

- The expected function name is defined by the shortname.
- The rest of the expected signature is defined by the contained arguments.

The Dlt module has to provide the implementation for all BswModuleEntries, which are referenced by the attribute outgoingCallback of the BswModuleDescription of the RTE, whose shortname start with "Rte Dlt".

[SWS_DIt_00284] [The DIt module shall be compliant to the VFB trace described in the AUTOSAR_RTE_SWS.] (RS_LT_00008)

[SWS_DIt_00276] [The Dlt module shall provide the possibility to trace all kinds of trace events described in the SWS RTE. | (RS_LT_00009)

[SWS_DIt_00027] [The DIt module shall provide the implementation of the hook functions for every configured event given by an BswModuleEntry, which owns a shortname starting with "Rte_DIt" provided by the BswModuleDefinition of the

[SWS_DIt_00335] [The prototype of this hook function is to be taken from the BswModuleEntry of the BSWModulDescription of the RTE.] ()

7.1.3.2 Generating hook functions

[SWS_DIt_00285] [Because the interface Dlt_SendTraceMessage is a SW-C interface, an internal function which is equivalent to Dlt_SendTraceMessage shall be implemented to be called by the generated hook functions.] (RS_LT_00009)

[SWS_DIt_00277] [In the hook function the internal representation of Dlt_SendTraceMessage shall be called. This call shall be in non-verbose mode.] (RS_LT_00009)

[SWS_DIt_00278] [The payload for this hook function call shall be filled with the arguments provided by the hook function. All data transported with the arguments shall be provided.] ()

[SWS_DIt_00632] [The argument data shall be written in raw format to the payload.]

[SWS_DIt_00279] [Every hook function shall get its own ContextId. In some cases some events can be bundled to the same ContextId. This shall mostly be done if a very large number of signals is traced. | ()

[SWS_DIt_00337] [The ApplicationID shall be "VFBT". | ()

[SWS_DIt_00484] [The Message Type (MSTP) entry in the generated trace message shall be set to DLT_TYPE_APP_TRACE, the Message Trace Info (MSTI) entry in this case shall be set to DLT_TRACE_VFB. | ()

[SWS_DIt_00280] [Because non-verbose mode is used, a unique Message ID as defined in [SWS_DIt_00031] shall be used for each call to ${\tt Dlt_SendTraceMessage.} \ \, \ \, \ \, ()$

Note:

The description for the Message ID-payload shall be generated and provided. This description can be generated from the SW-C description file, were the interface is described.

[SWS_DIt_00281] [In each hook function the trace status of the ContextId shall be checked.] ()

Figure 3 Requirement for hook function to check the trace status of the ContextId before call of Dlt_SendTraceMessage (vfb_actual_trace_status_contextXY is a freely named variable to hold the actual trace status for a specific ContextId)

[SWS_DIt_00282] [DIt shall use for every VFB trace hook function an own ContextId and thus handle for every VFB trace ContextId a separate trace status. This can be done with a separate variable.] ()

[SWS_DIt_00283] [A separate function shall be implemented to modify the trace status of VFB trace hook functions. This function shall be harmonized with the SW-C LogTraceSessionControl interface.] ()

7.1.4 Log messages from DEM

[SWS_DIt_00377] [The ApplicationID, ContextId and Message ID of a Log Message sent for a DEM event shall have the following values:

```
ApplicationID = "DEM"
ContextId = "STD0"
MessageID = 0x00000001
```

7.1.5 Log messages from DET

SW-Cs and BSW modules can report errors to the DET module. Such errors can be forwarded to the Dlt module as messages with a suitable content using the Dlt DetForwardErrorTrace.

Note:

1 ()

All parameters from the DET function <code>Det_ReportError</code> are forwarded to the DIt function <code>Dlt DetForwardErrorTrace</code> by the DET fan-out capability.

```
[SWS_DIt_00430] [The DIt module shall provide the
```

```
Dlt_DetForwardErrorTrace function for the fan-out capability of DET. J (RS_LT_00006)
```

[SWS_DIt_00376] [The ApplicationID, ContextId and MessageID of the Log Message send by DET shall have the following values:

```
ApplicationID = "DET"
ContextId = "STD"
```

MessageID = 0x00000002 LogLevel = "Error"

] ()

7.1.6 Recommendation for generation of Message IDs

The payload of non-verbose messages contains the Message ID. The Message ID shall be unique for an ECU. The problem is that Message IDs are provided by a SW-C (the user of Dlt) and at the point in time when coding of the log and trace message calls are done there is no instance to guarantee the uniqueness of used Message IDs.

A possible solution is to map all Log Messages in a virtual memory segment and then use the memory address as Message ID. Another solution is to have an authoring tool that is responsible for the uniqueness of the Message IDs.

In addition, it could be possible to fix Message ID values during the post build process, so uniqueness for the ECU can be guaranteed.

It is important to provide for every Message ID a description for the associated message.

[SWS_Dlt_00031] [MessageIds used for DEM (0x00000001) and DET (0x00000002), and Trace Messages (0x00000003) are reserved and therefore not usable for SW-Cs. | ()

7.1.7 Startup behavior

The Dlt module specifies several configuration parameters, which can be reconfigured during runtime via API calls or via Dlt control messages.

This means, that those configuration parameters respectively data structures, which are based on them, have to be loaded into runtime variables during the startup of the Dlt module.

In addition, it might happen that SW-Cs and/or BSW modules are already generating log and trace data even though the Dlt module itself has not been initialized yet. For this scenario, the Dlt module offers the possibility to buffer even this data until the Dlt module is initialized.

The described functionalities result in the requirements below:

[SWS_DIt_00003] [The Dlt module shall be able to buffer data coming from calls to Dlt_SendLogMessage and/or Dlt_SendTraceMessage even if the Dlt module has not been initialized yet.] (RS_LT_00036)

[SWS_DIt_00648] [When the Dlt_Init is called, the optional timer DltGeneralStartUpDelayTimer shall be started if configured. | ()

[SWS_DIt_00649] [If the parameter DltGeneralNvRAMSupport is disabled, static Dlt module configuration shall be used for initialization.] ()

[SWS_DIt_00005] [As soon as the Dlt module is initialized by Dlt_Init and the optional timer DltGeneralStartUpDelayTimer has expired, all the log and trace data, which has been buffered meanwhile, shall be processed according to SWS_Dlt_00651, using the configured filter settings. | ()

7.1.8 Persistent storage of configuration

The Dlt module offers the possibility to store configuration data in the NVRamManager module. Therefore, it is recommended to call the Dlt_Init function only after the NVRamManager module has been initialized.

The persistency functionality of the Dlt module supports the non-volatile saving of configuration values, which are modifiable during runtime.

The idea is to allow to customize the logging configuration during runtime and to assure that this configuration is recovered after an ECU reset or restart.

[SWS_DIt_00451] [If the parameter DltGeneralNvRAMSupport is set to TRUE, non-volatile memory blocks shall be used by the Dlt module to store the current Dlt configuration persistently.] ()

[SWS_DIt_00449] [If the parameter DltGeneralNvRAMSupport is set to TRUE, the Dlt module has to verify the validity of the non-volatile blocks used.] ()

[SWS_DIt_00350] [If the parameter DltGeneralNvRAMSupport is set to TRUE, the stored Dlt configuration shall be used as initial values. | ()

Note:

Initial values in this case are the initial values for the persistent stored values for the first startup of the ECU.

[SWS_DIt_00078] [Storing the current configuration to NvRAM shall only be done if the parameter DltGeneralNvRAMSupport is enabled and the storing has been explicitly requested by the Dlt Command "StoreConfiguration".] (RS_LT_00039)

Note:

To store the current configuration to NvRAM, the API NvM WriteBlock is used.

7.1.9 Sending of Log and Trace Messages

The Dlt data path describes the flow a Dlt Log and Trace Message takes from the source to the sink. The source can be either a SW-C or a BSW module, whereas the PDU Router is representing the sink.

The following figure provides an overview of the separate steps to send a Dlt message on the communication bus:

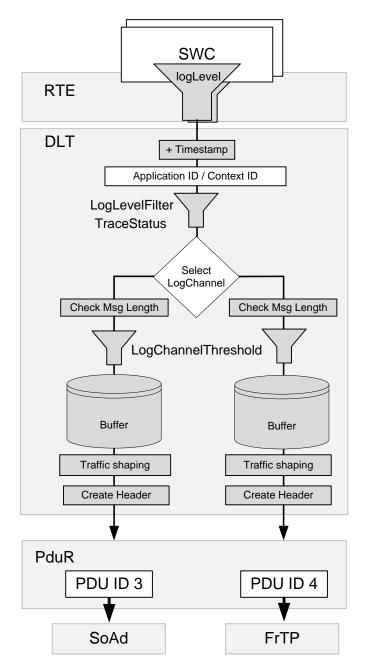

Figure 3 – Example Tx Data Path

Sending of Log and Trace messages is done with the dedicated functions Dlt SendLogMessage and Dlt SendTraceMessage.

Two additional functions exist that allow to give additional attributes to Log and Trace messages. These functions are named <code>Dlt_SendLogMessageWithAttributes</code> and <code>Dlt_SendTraceMessageWithAttributes</code> respectively. These two are pure supersets of the previously mentioned ones, which remain in the Standard for backwards-compatibility and convenience purposes, for the common case where no additional attributes are needed.

Please note that throughout this document, whenever the functions <code>Dlt_Send-LogMessage</code> or <code>Dlt_SendTraceMessage</code> are being mentioned, these need to be understood as a shorthand notation a for "<code>Dlt_SendLogMessage</code> or <code>Dlt_Send-LogMessageWithAttributes"</code> and "<code>Dlt_SendTraceMessage</code> or <code>Dlt_Send-TraceMessageWithAttributes"</code> respectively, unless otherwise noted.

[SWS_DIt_00787] [Calling the function Dlt_SendLogMessageWithAttributes with the parameter attributes set to NULL shall be equivalent to calling the function Dlt_SendLogMessage with the remaining parameters.]()

[SWS_DIt_00782] [Calling the function Dlt_SendTraceMessageWith-Attributes with the parameter attributes set to NULL shall be equivalent to calling the function Dlt SendTraceMessage with the remaining parameters.]()

[SWS_DIt_00783] [If the configuration parameter DltProtocolVersion is set to 1, a call to Dlt_SendLogMessageWithAttributes or Dlt_SendTraceMessage-WithAttributes where the attributes argument is non-NULL, shall return with DLT NOT_SUPPORTED.]()

[SWS_DIt_00650] [The following steps describe the logical order, in the context of calls to Dlt SendLogMessage or Dlt SendTraceMessage:

- 1. Generate timestamp (see 7.1.9.1)
- 2. Filter message (see 7.1.9.2)
- 3. Select target LogChannel(s) (see 7.1.9.3)
- 4. Check Message length (see 7.1.9.4)
- 5. Apply the current LogChannel threshold (see 7.1.9.5)
- 6. Copy Dlt message to LogChannel specific buffer (see 7.1.9.6)
- 7. Apply the message attributes, if any are present and supported (see 7.1.9.7)

Note:

Because of optimizations in an implementation, the order might be changed. For instance, a typical optimization could be, that the Dlt header, which is created by Dlt module for each Dlt message, is NOT saved to the LogChannel specific buffer per Dlt message, but is created on-the-fly directly before sending the message to PduR.

[SWS_DIt_00651] [The following steps have to be taken deferred/decoupled from the context of calls to Dlt_SendLogMessage or Dlt_SendTraceMessage:

- 8. Send Dlt message to PduR according to TrafficShaping settings. (see 7.1.9.8)
- 9. Create Dlt Header according to header settings (see 7.1.9.8)
- 10.Remove the Dlt message from the LogChannel specific buffer (see 7.1.9.10)] ()

7.1.9.1 Generating the timestamp

Depending of the current configuration, a timestamp may be added to the Dlt message.

[SWS_DIt_00652] [Only if the parameter <code>DltHeaderUseTimestamp</code> is set to TRUE, the Dlt module shall fetch a timestamp.] ()

[SWS_DIt_00653] [If the parameter <code>DltHeaderUseTimestamp</code> is set to TRUE, but the Dlt module cannot fetch a timestamp for any reason, the timestamp shall be set to <code>0x000000000.</code>] ()

[SWS_DIt_00654] [If the parameter DltHeaderUseTimestamp is set to TRUE and DltGeneralGptChannelRef is configured, the Dlt module shall call the API Gpt_GetTimeElapsed() with the configured channel reference (see DltGeneralGptChannelRef) to fetch the elapsed time. | ()

[SWS_DIt_00655] [If the parameter DltHeaderUseTimestamp is set to TRUE and DltGeneralStbMTimeBaseRef is configured, the Dlt module shall call the API StbM_GetCurrentTime() with the configured time base reference (see

 ${\tt DltGeneralStbMTimeBaseRef)}$ to fetch the current synchronized time and calculate the elapsed time. | ()

7.1.9.2 Message filtering

Message filtering means to accept or discard an incoming log or trace message based on the ApplicationId/ContextId tuple, which is assigned to that message.

Filtering differs slightly between Log Messages (Dlt_SendLogMessage) and trace messages (Dlt SendTraceMessage).

[SWS_Dit_00656] [For Dit Log Messages, the highest LogLevel Threshold shall be defined as "Verbose".] ()

[SWS_DIt_00657] [For DIt Log Messages, the lowest LogLevel Threshold shall be defined as "Filter off". | ()

Note:

The Dlt MessageLogLevelType defines all possible Log Message filter levels.

[SWS_DIt_00658] [For Log Message filtering the DIt internally manages LogLevel threshold to ApplicationId/ContextId tuple mappings (see configuration parameter DltLogLevelThreshold).] ()

[SWS_DIt_00659] [For trace message filtering the DIt internally manages trace activation state to ApplicationId/ContextId tuple mappings (see configuration parameter DltTraceStatusAssignment). | ()

Note:

The matching algorithm for finding the proper mapping element (containing a threshold log level value in the Log Message case respectively containing a trace activation state in the trace message case) is identical for Log Messages and trace messages.

[SWS_DIt_00661] [The DIt module shall find a matching mapping element (log level threshold respectively trace activation state) for the ApplicationId/ContextId tuple contained in a Dlt_SendLogMessage or Dlt_SendTraceMessage call. To do so, the following steps shall be performed:

- 1. Check whether a mapping element exists, where ApplicationId/ContextId tuple of mapping element equals to the ApplicationId/ContextId tuple of the log/trace message. If such a mapping element exists, the matching mapping element is found.
- 2. In case no match has been found in step 1, check whether a mapping element exists, where the ApplicationID equals the ApplicationID of the log/trace message and the ContextId of mapping element equals wildcard

- (value 0x0000000). If such a mapping element exists, the matching mapping element is found.
- 3. In case no match has been found in step 1 and 2, the matching mapping element is the current <code>DefaultLogLevelThreshold</code> respectively the current <code>DefaultTraceStatus</code>.

| () |

[SWS_DIt_00662] [In the Dlt_SendLogMessage case, the found mapping element is a log level threshold. If the log level value of the Log Message is numerically higher than this log level threshold, the Log Message is not further processed and E_OK is returned.] ()

[SWS_DIt_00663] [In the Dlt_SendTraceMessage case, the found mapping element is a trace activation state. If the value of the trace activation state is FALSE, the message is not further processed and E_OK is returned. | ()

7.1.9.3 Select target LogChannel

In this step, the DIt module identifies on which LogChannel(s) the log or tarce message will be transmitted.

[SWS_Dlt_00664] [For LogChannel selection the Dlt module manages LogChannel to ApplicationId/ContextId tuple mappings. (see configuration parameter DltLogChannelAssignmentSwcContextRef).]()

Note:

There can be several LogChannels configured for a given

ApplicationId/ContextId tuple contained in a Dlt_SendLogMessage or Dlt SendTraceMessage call.

[SWS_DIt_00665] [To find the matching LogChannels for the

- From all mapping elements, where ApplicationId/ContextId tuple of mapping element equals to the ApplicationId/ContextId tuple of the log/trace message, the LogChannel shall be added to the list of output LogChannels.
- 2. From all mapping elements, where ApplicationID of mapping element equals to the ApplicationID of the log/trace message AND the ContextId of mapping element equals wildcard (value 0x0000000), the LogChannel shall be added to the list of output LogChannels.
- 3. If the list of output LogChannels is still empty after step 1 and 2. The default LogChannel (see configuration parameter DltDefaultLogChannelRef) shall be added to the list of output LogChannels.

]()

7.1.9.4 Check message length

[SWS_DIt_00666] [If the DIt message length including the required DIt headers exceeds the configured value given by DltLogChannelMaxMessageLength for all assigned LogChannels, discard this DIt message and return DLT_E_MSG_TOO_LARGE. | ()

Note:

If the message is short enough for at least one assigned LogChannel, continue to process this message for all LogChannels where the message is short enough.

7.1.9.5 Apply LogChannel LogLevelThreshold

In this step, the DIt module decides, individually for each identified log and trace channel, whether the current log or trace message may pass or not.

[SWS_DIt_00667] [Log messages with a log level numerically higher than the configured value of LogChannel threshold for the identified LogChannel shall be discarded and E_OK shall be returned. This shall be done on each LogChannel from the list of output LogChannels for the Log Message, considering [SWS_DIt_00665].] ()

[SWS_DIt_00668] [Trace messages shall be filtered out, when the config parameter DltTraceStatus is FALSE for the identified LogChannel. That means they do not proceed to the next processing step and E_OK is returned.] ()

7.1.9.6 Copying Dlt message to the LogChannel buffer

In this step the Dlt module copies the Dlt message to all buffers of the LogChannels, which the Dlt message is assigned to.

[SWS_DIt_00669] [The DIt module shall copy the log/trace message which has passed the message filters to all assigned target LogChannel buffers where the DIt message length is not larger than DltLogChannelMaxMessageLength of the respective LogChannel.] ()

[SWS_DIt_00670] [If there was not enough space to copy the complete message to any of the assigned LogChannel's buffer, DLT_E_NO_BUFFER shall be returned and the Dlt log and trace message shall be discarded.

In addition, check each assigned buffer whether it was already full before, i.e., check DIt internal flags to store a buffer overflow event:

- If the buffer overflow flag is currently not set for this buffer:
 - Set the buffer overflow flag to indicate the occurrence of a buffer overflow
 - The Dlt log and trace message shall be discarded
- If the buffer overflow flag for this buffer was already set for this buffer:
 - The Dlt log and trace message shall be discarded

• Send Dlt Control Message(s) "BufferOverflowNotification" according to the configuration. Please refer to chapter 7.1.11.1.

]()

Note:

The cyclicly called Dlt_TxFunction checks the status of the buffer overflow flag and the debounce time for sending buffer overflow notifications. This function also sets back the flag cyclically according to a buffer overflow notification.

[SWS_Dit_00671] [If a new massage has been copied successfully to the assigned LogChannel's buffer, the message counter shall be increased by 1. This message counter value shall be stored for the Dit message. | ()

Note:

When the Dlt message is going to be transmitted, this message counter value will be written into the Message Counter Field (MCNT).

[SWS_DIt_00672] [If a new massage has been copied successfully to at least one LogChannel buffer, DLT_OK shall be returned. | ()

7.1.9.7 Apply the message attributes, if any are present and supported

Optional attributes can be added to a message when using the APIs Dlt_SendLogMessageWithAttributes or Dlt_SendTraceMessageWithAttributes, and if the configuration parameter DltProtocolVersion is set to 2 or higher.

The attributes are given as an additional function argument of type pointer to Dlt MessageAttributesType.

The Dlt_MessageAttributesType structure has been designed to be extensible; any future extension of this structure will be provided as new fields, either with an in-band "invalid" state (e.g. a null pointer), or with a separate bool flag denoting the existence of a meaningful value for the subsequent field.

Therefore, prior to calling a function defined in this standard which reads values from a Dlt_MessageAttributesType structure (such as

Dlt_SendLogMessageWithAttributes), the application shall ensure that all members of the structure, including any additional non-standardized members, are initialized with default initialization.

This can be done, for instance, with:

Dlt MessageAttributesType attributes = { 0 };

7.1.9.8 Sending messages from LogChannel Buffer

[SWS_DIt_00780] [The sending of DIt messages via the PduR API shall be decoupled from the Dlt_SendLogMessage and Dlt_SendTraceMessage API call.] ()

Note:

The decoupling is done because of the following reasons:

- 1. Shortening runtime of calls from the SW-Cs/BSWs which trigger log/trace messages, to reduce blocking time.
- 2. In case traffic shaping functionality is enabled, the transmissions have to be processed by an asynchronous cyclic BSW entity anyway.
- 3. In case retry feature is enabled a decoupled BSW entity, which cares for retries, is needed anyway.

[SWS_DIt_00673] [The DIt module shall transmit DIt messages collected in the LogChannel specific buffer from the context of the Dlt TxFunction function.] ()

[SWS_DIt_00674] [The DIt Message Header shall be assembled before PduR DltTransmit is called.] ()

Note:

For details regarding the assembling of the Dlt Message Header, please refer to the next section.

[SWS_DIt_00675] [The DIt module shall use the $PduR_DltTransmit$ function to send the DIt message with the configured TxPduld. | ()

[SWS_DIt_00677] [The DIt module shall monitor a transmit counter for each DIt message in a LogChannel specific buffer. Each time it calls PduR_DltTransmit for a DIt message in the buffer, it shall increment the transmit counter.] ()

7.1.9.9 Create Dlt message header

Assembling the Dlt Header

[SWS_DIt_00678] [The UEH bit shall be set to '1' if at least one of the parameters DItUseVerboseMode or DItUseExtHeaderInNonVerbMode is set to TRUE. Otherwise, the UEH bit shall be set to '0'.| ()

[SWS_DIt_00679] [The MSBF bit shall be set to '1' if the current platform is BIGENDIAN.] ()

[SWS_DIt_00680] [The MSBF bit shall be set to '0' if the current platform is LITTLEENDIAN.] ()

[SWS_DIt_00681] [The WEID bit shall be set to '1' if the parameter DItHeaderUseEculd is set to TRUE. Else, the WEID bit shall be set to '0'. | ()

[SWS_DIt_00682] [The WSID bit shall be set to '1' if the parameter DltHeaderUseSessionID is set to TRUE. Else, the WSID bit shall be set to '0'. | ()

[SWS_DIt_00683] [The WTMS bit shall be set to '1' if the parameter DltHeaderUseTimestamp is set to TRUE. Else, the WSID bit shall be set to '0'. | ()

[SWS_DIt_00684] [The VERS bits shall always be set to "001".] ()

[SWS_DIt_00685] [The MCNT field shall be set to the stored value of this DIt message when it is copied to the LogChannel's buffer. | ()

[SWS_DIt_00686] [The optional ECU field shall only exist if DltHeaderUseEcuId is set to TRUE. | ()

[SWS_DIt_00687] [The optional ECU field shall be set to the value configured in DltEcuIdValue. If the configured ECU IDis shorter than 4 byte, the remaining bytes shall be set to 0x00. | ()

[SWS_Dlt_00688] [The optional SEID field shall be set to the value configured via DltSwcSessionId and shall only exist if DltHeaderUseSessionID is set to TRUE.] ()

[SWS_DIt_00689] [The optional TMSP field shall contain the derived timestamp if DltHeaderUseTimestamp is set to TRUE. | ()

[SWS_DIt_00690] [The LEN field shall be set to the overall length of the finally assembled DIt Data Message, which shall be the sum of the length of the Header, the length of the optional Extended Header, and the length of the Payload. | ()

[SWS_DIt_00784] [If the parameter DltProtocolVersion is set to 2 or higher, then the WPVL bit shall be set to the value of the withPrivacyLevel field of the Dlt_MessageAttributesType value that has been passed to the API Dlt_SendLogMessageWithAttributes or Dlt_SendTraceMessageWithAttributes. Otherwise, the WPVL bit shall be set to false.]()

[SWS_DIt_00785] [If the parameter DltProtocolVersion is set to 2 or higher, and the WPVL bit has been set to true, then the PRLV field shall be set to the value of the privacyLevel field of the Dlt_MessageAttributesType value that has been passed to the API Dlt_SendLogMessageWithAttributes or Dlt_SendTraceMessageWithAttributes. Otherwise, the PRLV field shall be omitted.]()

Assembling the Dlt Extended Header

[SWS_DIt_00691] [If the parameter DltUseExtHeaderInNonVerbMode is set to TRUE, the Dlt Extended Header has to be generated for Dlt Data Messages:] ()

[SWS_DIt_00692] [The VERB bit shall be set to '1 'if the parameter DltUseVerboseMode is set to TRUE. Else, the VERB bit shall be set to '0'. |()

[SWS_DIt_00693] [The MSTP field shall be set to 0x0 if the Dlt message has to be assembled due to the API call Dlt_SendLogMessage.]()

[SWS_DIt_00694] [The MSTP field shall be set to 0x1 if the Dlt message has to be assembled due to the API call Dlt SendTraceMessage.]()

[SWS_DIt_00695] [The MTIN field shall be set accordingly to the Dlt_MessageLogInfoTyp value, which has been passed by the API Dlt_SendLogMessage.]()

[SWS_DIt_00696] [The MTIN field shall be set accordingly to the Dlt_MessageTraceInfoType value, which has been passed by the API Dlt_SendTraceMessage.]()

7.1.9.10 Removing messages from LogChannel buffer

[SWS_DIt_00697] [A DIt message, for which PduR_DltTransmit has been called, shall be removed from the LogChannel specific buffer in the following cases:

- PduR DltTransmit has returned with E_NOT_OK,
- A positive TX confirmation for this TxPduId has been received, or
- A negative TX confirmation for this TxPduld has been received and the transmit counter of the Dlt message is greater than the configured DltLogChannelMaxNumOfRetries.

I()

7.1.10 Receiving of Dlt commands

The DIt module can receive DIt commands via the Rx Data Path and/or via dedicated API calls (see chapter 8). These DIt commands can be used to control the DIt module.

[SWS_DIt_00698] [The DIt module shall ignore all received DIt control messages via the Rx Data Path in case the parameter DltGeneralRxDataPathSupport is set to FALSE. | ()

Note:

In case the Rx Data Path is disabled, the Dlt client can be controlled via the optional control APIs defined in chapter 8.

[SWS_DIt_00699] [If DltGeneralRxDataPathSupport is set to TRUE, the Dlt module shall process received Dlt control messages. | ()

[SWS_DIt_00700] [If a received Dlt command has been executed successfully, "OK" shall be returned.] ()

7.1.10.1 SetLogLevel

[SWS_DIt_00701] [If the DIt command "SetLogLevel" is requested, the new LogLevel shall be stored for the received tuple of ApplicationId/ContextId.] ()

[SWS_DIt_00702] [If the DIt command "SetLogLevel" is requested, but the received tuple of ApplicationId/ContextId is unknown, the DIt command shall be answered with "ERROR".] ()

7.1.10.2 SetTraceStatus

[SWS_DIt_00703] [If the DIt command "SetTraceStatus" is requested, the new trace status shall be stored for the received tuple of ApplicationId/ContextId.] ()

[SWS_DIt_00704] [If the DIt command "SetTraceStatus" is requested, but the addressed tuple of ApplicationId/ContextId is unknown, the DIt command shall be answered with "ERROR". | ()

7.1.10.3 GetLogInfo

[SWS_DIt_00705] [If the DIt command "GetLogInfo" is requested, the requested LogInfo shall be returned.] ()

[SWS_DIt_00706] [If the Dlt command "GetLogInfo" is requested, but the addressed tuple of ApplicationId/ContextId is unknown, the Dlt command shall be answered with "ERROR".] ()

7.1.10.4 GetDefaultLogLevel

[SWS_DIt_00708] [If the DIt command "GetDefaultLogLevel" is requested, the current value of the parameter DltDefaultLogLevel shall be returned.] ()

7.1.10.5 StoreConfiguration

[SWS_DIt_00709] [If the DIt command "StoreConfiguration" is requested and the configuration parameter DltGeneralNvRAMSupport is set to TRUE, the following steps shall be performed:

- Call NvM_WriteBlock to store the current configuration of the LogChannelAssignment, LogChannelThreshold, and the LogLevelFilter.
 - o If NvM_WriteBlock returned with E_OK, the Dlt command "StoreConfiguration" shall return with "OK".
 - o If NvM_WriteBlock returned with something else than E_OK, the Dlt command "StoreConfiguration" shall return with "ERROR".

]()

[SWS_DIt_00710] [If the DIt command "StoreConfiguration" is requested and the configuration parameter DltGeneralNvRAMSupport is set to FALSE, the DIt command "StoreConfiguration" shall return "NOT_SUPPORTED". | ()

7.1.10.6 ResetToFactoryDefault

[SWS_DIt_00711] [If the Dlt command "ResetToFactoryDefault" is requested and if the parameter DltGeneralNvRAMSupport is set to FALSE, reset the following runtime parameters to the values stored in the Dlt module's static configuration:

- DltDefaultLogLevel
- DltThreshold
- DltDefaultTraceStatus
- DltLogChannelThreshold
- DltDefaultLogChannelRef

I()

[SWS_DIt_00712] [If the DIt command "ResetToFactoryDefault" is requested and if the parameter DltGeneralNvRAMSupport is set to TRUE, delete the stored configuration of the NvM by calling NvM_EraseNvBlock and reset the following runtime parameters to the values stored in the DIt module's static configuration:

- DltDefaultLogLevel
- DltThreshold
- DltDefaultTraceStatus
- DltLogChannelThreshold
- DltDefaultLogChannelRef

I()

[SWS_DIt_00713] [If the Dlt command "ResetToFactoryDefault" is requested and if the parameter DltGeneralNvRAMSupport is set to FALSE, "OK" shall be returned if the Dlt module reset the current configuration values to the default configuration successfully.] ()

[SWS_DIt_00714] [If the DIt command "ResetToFactoryDefault" is requested and the parameter <code>DltGeneralNvRAMSupport</code> is set to TRUE, response with "ERROR"

- if the Dlt module could not reset the current configuration to the static default configuration or
- if the stored configuration of the NvM could not be deleted.] ()

7.1.10.7 SetMessageFiltering

[SWS_DIt_00775] [If the Dlt command "SetMessageFiltering" is requested, all the Dlt filters shall be enabled/disabled as requested, and the Dlt command shall be answered with "OK". Disabled filters will allow all messages to pass. | ()

7.1.10.8 SetDefaultLogLevel

[SWS_DIt_00715] [If the DIt command "SetDefaultLogLevel" is requested, the parameter DltDefaultLogLevel shall be updated to the received new LogLevel.] ()

7.1.10.9 SetDefaultTraceStatus

[SWS_DIt_00716] [If the DIt command "SetDefaultTraceStatus" is requested, the parameter DltDefaultTraceStatus shall be updated to the received new TraceStatus. | ()

7.1.10.10 GetDefaultTraceStatus

[SWS_DIt_00717] [If the DIt command "GetDefaultTraceStatus" is requested, the current value of the parameter DltDefaultTraceStatus shall be returned. | ()

7.1.10.11 GetLogChannelNames

[SWS_DIt_00718] [If the Dlt command "GetLogChannelNames" is requested, the number of configured LogChannels and requested number of LogChannel names given by the parameter DltLogChannelName shall be returned.] ()

7.1.10.12 GetTraceStatus

[SWS_DIt_00719] [If the DIt Command "GetTraceStatus" is requested, the TraceStatus shall be returned for the received tuple of ApplicationId/ContextId.] ()

7.1.10.13 SetLogChannelAssignment

[SWS_DIt_00720] [If the DIt command "SetLogChannelAssignment" is requested with parameter addRemoveOp set to DLT_ASSIGN_ADD, add the tuple of ApplicationId/ContextId to the LogChannel with the name provided by the parameter logChannelName. The DIt command shall return "OK" even if the tuple was already assigned to the requested LogChannel before. [()

[SWS_DIt_00721] [If the DIt command "SetLogChannelAssignment" is requested with parameter addRemoveOp set to DLT_ASSIGN_REMOVE , remove the tuple of ApplicationId/ContextId from the LogChannel with the name provided by the parameter logChannelName. The DIt command shall return "OK" even if the tuple was not assigned to the requested LogChannel before.] ()

Note:

If a tuple of ApplicationId/ContextId is not assigned explicitly to any specific LogChannel (any more), the mandatory default LogChannel (see DltDefaultLogChannelRef) will be used for transmission.

[SWS_DIt_00722] [If the Dlt command "SetLogChannelAssignment" is requested with an unknown tuple of ApplicationId/ContextId or an unknown LogChannel name, the Dlt command shall return "ERROR".] ()

7.1.10.14 SetLogChannelThreshold

[SWS_DIt_00723] [If the DIt command "SetLogChannelThreshold" is requested, the LogChannelThreshold of the addressed LogChannel shall be set to the value received by the parameter newThreshold. | ()

[SWS_DIt_00724] [If the DIt command "SetLogChannelThreshold" is requested and the logChannelName and/or the newThreshold is unknown, the DIt command shall return "ERROR". | ()

7.1.10.15 GetLogChannelThreshold

[SWS_DIt_00725] [If the DIt command "GetLogChannelThreshold" is requested, the LogChannelThreshold of the addressed LogChannel shall be returned. | ()

[SWS_DIt_00726] [If the DIt command "GetLogChannelThreshold" is requested and the logChannelName or the newThreshold is unknown, the DIt command shall return "ERROR". | ()

7.1.11 Sending of Dlt commands

Typically, the Dlt module receives Dlt commands generated by a Dlt logging tool, which are answered by the Dlt module. Only two Dlt commands are triggered for sending by the Dlt module itself:

- GetLogInfo (only in case one or more SW-Cs register/unregister themselves)
- BufferOverflowNotification (in case of a buffer overflow)

7.1.11.1 BufferOverflowNotification

The buffer overflow notification is used to inform the Dlt Logging tool about the loss of Dlt messages. The amount of BufferOverflowNotifications on the bus can be limited/debounced by configuration. This notification contains a counter which indicates the amount of lost Dlt messages since the last BufferOverflowNotification.

[SWS_DIt_00776] [If the DIt module detects a buffer overflow, it shall send a DIt command "BufferOverflowNotification" cyclically (see DItLogChannelBufferOverflowTimer) as long as the buffer is still full. | ()

[SWS_DIt_00777] [The parameter overflowCounter of the Dlt control message "BufferOverflowNotification" shall be set to the number of lost Dlt messages since the last transmission of the "BufferOverflowNotification". | ()

7.2 Error classification

7.2.1 Development errors

[SWS_DIt_00727][

[6116_81_00121]		
Type of error	Related error code	Error value
API service called with wrong parameter	DLT_E_PARAM	0x01
Null pointer has been passed as an argument	DLT_E_PARAM_POINTER	0x02
Initialization failed	DLT_E_INIT_FAILED	0x03
Registration failed	DLT_E_REGISTRATION	0x04

()

7.2.2 Runtime errors

[SWS_DIt_00728][

Type of error	Related error code	Error value
Message could not be sent	DLT_E_SKIPPED_ TRANSMISSION	0x05
A deprecated parameter with a value different to 0 for a Dlt command has been received	DLT_E_DEPRECATED_ PARAMETER	0x06
Multiple Control Requests at the same time	DLT_E_MULTIPLE_ REQUESTS	0x07

(()

7.2.3 Transient faults

There are no transient faults.

7.2.4 Production errors

There are no production errors.

7.2.5 Extended production errors

There are no extended production errors.

8 API specification

8.1 Imported types

In this section all types imported from the following modules are listed:

The following types are imported from the specified modules:

[SWS_DIt_91009][

Module	Header File	Imported Type
	ComStack_Types.h	BufReq_ReturnType
	ComStack_Types.h	PduldType
Comptack Tunes	ComStack_Types.h	PduInfoType
ComStack_Types	ComStack_Types.h	PduLengthType
	ComStack_Types.h	RetryInfoType
	ComStack_Types.h	TpDataStateType
Cnt	Gpt.h	Gpt_ChannelType
Gpt	Gpt.h	Gpt_ValueType
NvM	M Rte_NvM_Type.h NvM_BlockIdType	
	Rte_StbM_Type.h	StbM_SynchronizedTimeBaseType
	Rte_StbM_Type.h	StbM_TimeBaseStatusType
	Rte_StbM_Type.h	StbM_TimeStampExtendedType (obsolete)
StbM	Rte_StbM_Type.h	StbM_TimeStampType
	Rte_StbM_Type.h	StbM_TimeTupleType
	Rte_StbM_Type.h	StbM_UserDataType
	StbM.h	StbM_VirtualLocalTimeType
Std	Std_Types.h	Std_ReturnType
Siu	Std_Types.h	Std_VersionInfoType

8.2 Type definitions

8.2.1 Dlt_ConfigType

[SWS_DIt_00437][

[OVIO_DIL_OV	, and a second s		
Name	Dlt_ConfigT	уре	
Kind	Structure		
	implementa	tion specific	
Elements	Туре	Type	
	Comment The content of the initialization data structure is implementation specific		
Description	This is the type of the data structure containing the initialization data for Dlt.		
Available via	Dlt.h		

(SRS_BSW_00414)

8.2.2 Dlt_MessageType

[SWS_DIt_00224][

Name	Dlt_MessageType		
Kind	Enumeration		
	DLT_TYPE_LOG	0x00	A log message
	DLT_TYPE_APP_ TRACE	0x01	A trace message
Range	DLT_TYPE_NW_ TRACE	0x02	A message forwarded from a communication bus (like CAN, FlexRay)
	DLT_TYPE_ CONTROL	0x03	A message for internal use/control sent between DIt module and external client.
Description	This type describes the type of the message.		
Available via	Dlt.h		

]()

8.2.3 Dlt_MessageIDType

[SWS_DIt_00228]{OBSOLETE} [

Name	Dlt_MessageIDType (OBSOLETE)
------	------------------------------

Specification of Diagnostic Log and Trace AUTOSAR CP R22-11

Kind	Array	Element type	uint8
Size	4 Elements		
Description	Contains the unique mode. Tags: atp.Status=Of	MessageId for a message. This is only relevageS	ant in non-verbose
Available via	Dlt.h		

]()

8.2.4 Dlt_MessageNetworkTraceInfoType

[SWS_Dlt_00233][

[3443_DIL_002	5_Dit_00233]			
Name	Dlt_MessageNetworkTraceInfoType			
Kind	Enumeration			
	DLT_NW_TRACE_IPC	0x01	Inter process communication	
	DLT_NW_TRACE_CAN	0x02	CAN communication	
	DLT_NW_TRACE_FLEXRAY	0x03	Flexray communication	
Range	DLT_NW_TRACE_MOST	0x04	MOST communication	
	DLT_NW_TRACE_ETHERNET	0x05	Ethernet communication	
	DLT_NW_TRACE_SOMEIP	0x06	SOME/IP communication	
Description	This type describes transported type of a Dlt BUSMESSAGE.			
Available via	Dlt.h			

]()

8.2.5 Dlt_MessageAttributesType

The Dlt_MessageAttributesType has at least the following members:

[SWS_DIt_91010][

Name	Dlt_MessageAttributesType	
Kind	Structure	
	withPrivacyLevel	
Elements	Туре	boolean
	Comment	

	privacyLevel		
	Туре	uint8	
	Comment		
Description			
Available via	Rte_Dlt_Type.h		

8.3 Function definitions

This is a list of functions provided for upper layer modules.

8.3.1 Dlt_Init

[SWS_Dlt_00239][

Service Name	Dlt_Init	
Syntax	void Dlt_In: const Dlt_	it (_ConfigType* config
Service ID [hex]	0x01	
Sync/Async	Synchronous	
Reentrancy	Non Reentrant	
Parameters (in)	config	Pointer to a DLT configuration structure
Parameters (inout)	None	
Parameters (out)	None	
Return value	None	
Description	DIt is using the NVRamManager and is to be initialized very late in the ECU startup phase. The DIt_Init() function should be called after the NVRamManager is initialized.	
Available via	Dlt.h	

J(SRS_BSW_00344, SRS_BSW_00404, SRS_BSW_00405, SRS_BSW_00101, SRS_BSW_00407, SRS_BSW_00358, SRS_BSW_00414)

[SWS_DIt_00453] [If the parameter <code>DltGeneralNvRAMSupport</code> is set to TRUE, the DIt module shall use the API $NvM_ReadBlock$ of the NVRAM module for restoring the values from persistent storage for the variables required by [SWS_DIt_00239] in the Dlt Init function.] (RS_LT_00039)

8.3.2 Dlt_GetVersionInfo

[SWS_Dlt_00271][

Service Name	Dlt_GetVersionInfo	
Syntax	<pre>void Dlt_GetVersionInfo (Std_VersionInfoType* versioninfo)</pre>	
Service ID [hex]	Ox02	
Sync/Async	Synchronous	
Reentrancy	Reentrant	
Parameters (in)	None	
Parameters (inout)	None	
Parameters (out)	versioninfo Pointer to where to store the version information of this module.	
Return value	None	
Description	Returns the version information of this module.	
Available via	Dlt.h	

(SRS_BSW_00402)

8.3.3 Dlt_SendTraceMessage

[SWS_Dlt_00243][

Service Name	Dlt_SendTraceMessage			
Syntax	<pre>Std_ReturnType Dlt_SendTraceMessage (Dlt_SessionIDType sessionId, const Dlt_MessageTraceInfoType* traceInfo, const uint8* traceData, uint16 traceDataLength)</pre>			
Service ID [hex]	0x04			
Sync/Async	Synchronous			
Reentrancy	Reentrant			
Parameters	sessionId Number of the module (Module ID within BSW, Port defined			

(in)		argument value within SW-C)			
	traceInfo Structure containing the relevant information for filtering the message.				
	traceData	traceData Buffer containing the parameters to be traced. The contents of this pointer represents the payload of the Trace Message to be sent.			
	traceData Length	Length of the data buffer traceData			
Parameters (inout)	None				
Parameters (out)	None				
Return value	Std ReturnType E_OK: The required operation succeeded. DLT_E_MSG_TOO_LARGE: The message is too large for all LogChannels. DLT_E_NO_BUFFER: Not enough buffer available, the Dlt message cannot be buffered for at least one LogChannel. DLT_E_UNKNOWN_SESSION_ID: The provided session id is unknown.				
Description	The service represents the interface to be used by basic software modules or by software components to trace parameters.				
Available via	Dlt.h				

J(RS_LT_00003) J

8.3.4 Dlt_SendLogMessage

[SWS Dlt 00241][

TO 11.0 _ 2 11_002	10_DR_002+1]			
Service Name	Dlt_SendLogMessage			
Syntax	<pre>Std_ReturnType Dlt_SendLogMessage (Dlt_SessionIDType sessionId, const Dlt_MessageLogInfoType* logInfo, const uint8* logData, uint16 logDataLength)</pre>			
Service ID [hex]	0x03			
Sync/Async	Synchronous			
Reentrancy	Reentrant			
Parameters (in)	sessionId	For SW-C this is not visible (Port defined argument value), for BSW-modules it is the module number		
	logInfo	Structure containing the relevant information for filtering the message.		

	logData Buffer containing the parameters to be logged. The contents of the pointer represents the payload of the Log Message to be sent.		
	logData Length	Length of the data buffer logData.	
Parameters (inout)	None		
Parameters (out)	None		
Return value	Std ReturnType DLT_OK: The required operation succeeded. DLT_E_MSG_TOO_LARGE: The message is too large for all LogChannels DLT_E_NO_BUFFER: The LogMessage could not be buffered at any assigned LogChannel DLT_E_UNKNOWN_SESSION_ID: The provided session id is unknown.		
Description	The service represents the interface to be used by basic software modules or by software component to send Log Messages.		
Available via	Dlt.h		

J(RS_LT_00003)

8.3.5 Dlt_RegisterContext

[SWS_DIt_00245][

Service Name	Dlt_RegisterContext		
Syntax	Std_ReturnType Dlt_RegisterContext (Dlt_SessionIDType sessionId, Dlt_ApplicationIDType appId, Dlt_ContextIDType contextId, const uint8* appDescription, uint8 appDescLen, const uint8* contextDescription, uint8 contextDescLen)		
Service ID [hex]	0x05		
Sync/Async	Synchronous		
Reentrancy	Reentrant		
Parameters	sessionId	number of the module (Module ID within BSW, Port defined argument value within SW-C)	
(in)	appld	the ApplicationId	
	contextId	the ContextId	

Specification of Diagnostic Log and Trace AUTOSAR CP R22-11

	appDescription	Points to description string for the provided ApplicationId. At maximum 255 characters are interpreted.	
	appDescLen	The length of the description for the ApplicationId string (number of characters of description string).	
	contextDescription	Points to description string for the provided context. At maximum 255 characters are interpreted.	
	contextDescLen	The length of the description string (number of characters of description string).	
Parameters (inout)	None		
Parameters (out)	None		
Return value	E_OK: The required operation succeeded DLT_E_CONTEXT_ALREADY_REG: The software module context has already registered DLT_E_UNKNOWN_SESSION_ID: The provided session id is unknown.		
Description	The service has to be called when a software module wants to use services offered by DLT software component for a specific context. If a ContextId is being registered for an already registered ApplicationId then appDescription can be NULL and len_appDescription zero.		
Available via	Dlt.h		

J(RS_LT_00033)

8.3.6 Dlt_UnregisterContext

[SWS_DIt_00769][

Service Name	Dlt_UnregisterContext		
Syntax	<pre>Std_ReturnType Dlt_UnregisterContext (Dlt_SessionIDType sessionId, Dlt_ApplicationIDType appId, Dlt_ContextIDType contextId)</pre>		
Service ID [hex]	0x16		
Sync/Async	Synchronous		
Reentrancy	Reentrant		
Parameters (in)	sessionId	number of the module (Module ID within BSW, Port defined argument value within SW-C)	
	appld	the ApplicationId	
	contextId	the ContextId	

Parameters (inout)	None	
Parameters (out)	None	
Return value	Std_Return- Type	E_OK: The required operation succeeded. DLT_E_CONTEXT_NOT_YET_REG: The software module context has not registered before. DLT_E_UNKNOWN_SESSION_ID: The provided session id is unknown.
Description	The service has to be called when a software module is going to be stopped.	
Available via	Dlt.h	

J(RS_LT_00033)

8.3.7 Dlt_DetForwardErrorTrace

[SWS_DIt_00432][

[3443_DIL_002			
Service Name	Dlt_DetForwardErrorTrace		
Syntax	<pre>void Dlt_DetForwardErrorTrace (uint16 moduleId, uint8 instanceId, uint8 apiId, uint8 errorId)</pre>		
Service ID [hex]	0x07		
Sync/Async	Synchronous		
Reentrancy	Non Reen	trant	
	module Id	Module ID of calling module.	
Parameters	instance Id	The identifier of the index based instance of a module, starting from 0. If the module is a single instance module it shall pass 0 as the instanceId.	
(in)	apild	ID of API service in which error is detected (defined in SWS of calling module)	
	errorld	ID of detected development error (defined in SWS of calling module).	
Parameters (inout)	None		
Parameters (out)	None		
Return value	None		

Description	Service to forward error reports from Det to Dlt.	
Available via	Dlt_Det.h	

J(RS_LT_00006)

8.3.8 Dlt_SetLogLevel

[SWS_DIt_00252][

Service Name	Dlt_SetLogLevel		
Syntax	Std_ReturnType Dlt_SetLogLevel (Dlt_ApplicationIDType appId, Dlt_ContextIDType contextId, Dlt_MessageLogLevelType newLogLevel)		
Service ID [hex]	0x08		
Sync/Async	Synchronous		
Reentrancy	Reentrant		
	appld	ID of the SW-C	
Parameters (in)	contextId	ID of the context	
	newLogLevel	new log level to set	
Parameters (inout)	None		
Parameters (out)	None		
Return value	Std_ReturnType	E_OK: No error occurred E_NOT_OK: LogLevel could not be changed	
Description	This service is used to change the LogLevel for the given tuple of ApplicationID/ContextID.		
Available via	Dlt.h		

J(RS_LT_00004, RS_LT_00038)

8.3.9 Dlt_SetTraceStatus

[SWS_Dlt_00254][

Service Name	Dlt_SetTraceStatus		
Syntax	Std_ReturnType Dlt_SetTraceStatus (Dlt_ApplicationIDType appId, Dlt_ContextIDType contextId, boolean newTraceStatus)		
Service ID [hex]	0x09		
Sync/Async	Synchronous		
Reentrancy	Non Reentrant		
	appld	ID of the SW-C	
Parameters (in)	contextld	ID of the context	
	newTraceStatus	New trace status	
Parameters (inout)	None		
Parameters (out)	None		
Return value	Std_ReturnType	E_OK: No error occurred E_NOT_OK: Trace status could not be changed	
Description	The service Dlt_SetTraceStatus sets the trace status for a specific tuple of ApplicationID and ContextID.		
Available via	Dlt.h		

J(RS_LT_00004, RS_LT_00038)

8.3.10 Dlt_GetLogInfo

[SWS_DIt_00732][

Service Name	Dlt_GetLogInfo		
Syntax	<pre>Std_ReturnType Dlt_GetLogInfo (uint8 options, Dlt_ApplicationIDType appId, Dlt_ContextIDType contextId, uint8* status, Dlt_LogInfoType* logInfo)</pre>		
Service ID [hex]	0x0a		
Sync/Async	Synchronous		
Reentrancy	Non Reentrant		
Parameters (in)	options	Used to filter the response in respect to the ApplicationId, Context	

Specification of Diagnostic Log and Trace AUTOSAR CP R22-11

Available via	the corresponding log level. Dlt.h	
Description	Called to request information about registered ApplicationIds, their ContextIds and	
Return value	Std_Return- Type	E_OK: No error occurred E_NOT_OK: LogInfo could not be returned
(out)	logInfo	Details about the returned Application IDs
Parameters	status	
Parameters (inout)	None	
	contextId	Representation of the ContextId
	appld	Representation of the ApplicationId
		Id and Trace Status information

]()

8.3.11 Dlt_GetDefaultLogLevel

[SWS Dlt 00733][

[3M3_DI(_00/33]			
Service Name	Dlt_GetDefaultLogLevel		
Syntax	<pre>Std_ReturnType Dlt_GetDefaultLogLevel (Dlt_MessageLogLevelType* defaultLogLevel)</pre>		
Service ID [hex]	0x18		
Sync/Async	Synchronous		
Reentrancy	Non Reentrant		
Parameters (in)	None		
Parameters (inout)	None		
Parameters (out)	defaultLogLevel	Returns the stored LogLevel setting	
Return value	Std_ReturnType		
Description	Returns the Default Log Level currently used by the Dlt module. The returned Log Level might differ from the one which is stored non volatile.		
Available via	Dlt.h		

[SWS_DIt_00734] [A call to Dlt_GetDefaultLogLevel shall return with E_OK if the Dlt module provided the current value of the parameter DltDefaultLogLevel. | ()

[SWS_DIt_00735] [A call to Dlt_GetDefaultLogLevel shall return with E_NOT_OK if the Dlt module cannot provide the current value of the parameter DltDefaultLogLevel. | ()

8.3.12 Dlt_StoreConfiguration

[SWS_DIt_00736][

[3442_DII_00730]		
Service Name	Dlt_StoreConfigura	ation
Syntax	<pre>Std_ReturnType Dlt_StoreConfiguration (void)</pre>	
Service ID [hex]	0x1a	
Sync/Async	Synchronous	
Reentrancy	Non Reentrant	
Parameters (in)	None	
Parameters (inout)	None	
Parameters (out)	None	
Return value	Std_ReturnType	E_OK: No error occurred E_NOT_OK: The configuration could not be stored DLT_E_NOT_SUPPORTED: Service is not supported
Description	Copies the current Dlt configuration to NvRAM by calling NvM_WriteBlock().	
Available via	Dlt.h	

]()

[SWS_DIt_00737] [If the parameter DltGeneralNvRAMSupport is set to FALSE, a call to Dlt_StoreConfiguration shall return with DLT_NOT_SUPPORTED.]()

[SWS_DIt_00729] [If the parameter DltGeneralNvRAMSupport is set to TRUE, a call to Dlt_StoreConfiguration shall return with DLT_E_ERROR in case the call to NvM WriteBlock returned with E_NOT_OK. | ()

[SWS_DIt_00738] [If the parameter DltGeneralNvRAMSupport is set to TRUE, a call to Dlt_StoreConfiguration shall return with DLT_OK in case the call to NvM WriteBlock returned with E_OK.] ()

8.3.13 Dlt_ResetToFactoryDefault

[SWS_Dlt_00739][

[24/2_DIT_00	0/39]		
Service Name	Dlt_ResetToFactoryDefau	ılt	
Syntax	<pre>Std_ReturnType Dlt_ResetToFactoryDefault (void)</pre>		
Service ID [hex]	0x06		
Sync/Async	Synchronous		
Reentrancy	Non Reentrant		
Parameters (in)	None		
Parameters (inout)	None		
Parameters (out)	None		
Return value		E_OK: Configuration has been reset successfully E_NOT_OK: Configuration has not been reset	
Description	The service Dlt_ResetToFactoryDefault sets the LogLevel and TraceStatus back to the persistently stored default values. If the feature NvMRAM support is enabled, all stored Dlt values in the NvM are deleted.		
Available via	Dlt.h		

]()

8.3.14 Dlt_SetMessageFiltering

[SWS_DIt_00770][

Service Name	Dlt_SetMessageFiltering
Syntax	<pre>Std_ReturnType Dlt_SetMessageFiltering (boolean status)</pre>

Specification of Diagnostic Log and Trace AUTOSAR CP R22-11

Service ID [hex]	0x1b		
Sync/Async	Synchronous		
Reentrancy	Non Reentrant		
Parameters (in)	status TRUE: enable message filtering FALSE: disable message filtering		
Parameters (inout)	None		
Parameters (out)	None		
Return value	Std_ReturnType		
Description	Switches on/off the message filtering functionality of the Dlt module. If disabled, all the messages will pass the filter.		
Available via	Dlt.h		

]()

8.3.15 Dlt_SetDefaultLogLevel

[SWS_Dlt_00740][

Service Name	Dlt_SetDefaultLogLevel		
Syntax	<pre>Std_ReturnType Dlt_SetDefaultLogLevel (Dlt_MessageLogLevelType newLogLevel)</pre>		
Service ID [hex]	0x11		
Sync/Async	Synchronous		
Reentrancy	Reentrant		
Parameters (in)	newLogLevel	sets the new filter value	
Parameters (inout)	None		
Parameters (out)	None		
Return value	Std_ReturnType	E_OK: No error occurred E_NOT_OK: Default LogLevel could not be set	
Description	Called to modify the pass through range for Log Messages for all not explicit set ContextIds.		
Available via	Dlt.h		

[SWS_DIt_00741] [If a call to $Dlt_SetDefaultLogLevel$ successfully set the requested DefaultLogLevel, it shall return with E_OK. | ()

[SWS_DIt_00742] [If a call to Dlt_SetDefaultLogLevel could not set the requested DefaultLogLevel, it shall return with E_NOT_OK. | ()

8.3.16 Dlt_SetDefaultTraceStatus

[SWS Dlt 00743][

[0110_Dit_00743]		
Service Name	Dlt_SetDefaultTraceStatus	
Syntax	<pre>Std_ReturnType Dlt_SetDefaultTraceStatus (boolean newTraceStatus)</pre>	
Service ID [hex]	0x12	
Sync/Async	Synchronous	
Reentrancy	Reentrant	
Parameters (in)	newTraceStatus	enabling/disabling of Trace messages
Parameters (inout)	None	
Parameters (out)	None	
Return value	Std_ReturnType	E_OK: No error occurred E_NOT_OK: Default Trace Status could not be set
Description	Called to enable or disable trace messages for all not explicitly set ContextIds.	
Available via	Dlt.h	

(()

[SWS_DIt_00744] [If a call to Dlt_SetDefaultTraceStatus successfully set the requested new DefaultTraceStatus, it shall return with E_OK. | ()

[SWS_DIt_00745] [If a call to $Dlt_SetDefaultTraceStatus$ could not set the requested DefaultTraceStatus, it shall return with E_NOT_OK. | ()

8.3.17 Dlt_GetDefaultTraceStatus

[SWS_Dlt_00746][

Service Name	Dlt_GetDefaultTraceStatus		
Syntax	<pre>Std_ReturnType Dlt_GetDefaultTraceStatus (boolean* traceStatus)</pre>		
Service ID [hex]	0x19		
Sync/Async	Synchronous		
Reentrancy	Reentrant		
Parameters (in)	None		
Parameters (inout)	None		
Parameters (out)	traceStatus	current trace status (enabled/disabled)	
Return value	Std_ReturnType	E_OK: No error occurred E_NOT_OK: Default Trace Status could not be returned	
Description	Returns the current Trace Status of the addressed LogChannel.		
Available via	Dlt.h		

[SWS_DIt_00747] [If a call to Dlt_GetDefaultTraceStatus provided the current DefaultTraceStatus, it shall return with E_OK. | ()

[SWS_DIt_00748] [If a call to $Dlt_GetDefaultTraceStatus$ could not provide the DefaultTraceStatus, it shall return with E_NOT_OK. | ()

8.3.18 Dlt_GetLogChannelNames

[SWS_DIt_00749][

Service Name	Dlt_GetLogChannelNames	
Syntax	<pre>Std_ReturnType Dlt_GetLogChannelNames (uint8* numberOfLogChannels, Dlt_LogChannelNameType* logChannelNames)</pre>	
Service ID [hex]	0x17	
Sync/Async	Synchronous	
Reentrancy	Non Reentrant	
Parameters (in)	None	

Specification of Diagnostic Log and Trace AUTOSAR CP R22-11

Parameters (inout)	numberOfLog Channels	Contains the number of requested LogChannels names. On Return it holds the number of configured LogChannels
Parameters (out)	logChannelNames	Returns a list of configured LogChannel names
Return value	Std_ReturnType	E_OK: No error occurred E_NOT_OK: LogChannelNames could not be returned
Description	The caller provides the number of logChannelNames to be returned. The function returns the requested amount of LogChannelNames and updates numberOfLog Channels as the outgoing information on how many LogChannels are actually configured.	
Available via	Dlt.h	

]()

8.3.19 Dlt_GetTraceStatus

[SWS_DIt_00750][

[2449_117_00720]			
Service Name	Dlt_GetTraceStatu	us	
Syntax	<pre>Std_ReturnType Dlt_GetTraceStatus (Dlt_ApplicationIDType appId, Dlt_ContextIDType contextId, boolean* traceStatus)</pre>		
Service ID [hex]	0x1f		
Sync/Async	Synchronous		
Reentrancy	Non Reentrant		
Parameters (in)	appld	ApplicationId	
Parameters (m)	contextId	ContextId	
Parameters (inout)	None		
Parameters (out)	traceStatus current Trace Status of the tuple ApplicationId/ContextId		
Return value	Std_ReturnType		
Description	Returns the current Trace Status for a given tuple ApplicationId/ContextId.		
Available via	Dlt.h		

8.3.20 Dlt_SetLogChannelAssignment

[SWS_Dlt_00751][

Service Name		annelAssignment	
Syntax	Std_ReturnType Dlt_SetLogChannelAssignment (Dlt_ApplicationIDType appId, Dlt_ContextIDType contextId, Dlt_LogChannelNameType logChannelName, Dlt_AssignmentOperation addRemoveOp)		
Service ID [hex]	0x20		
Sync/Async	Synchronous		
Reentrancy	Non Reentrant		
	appld	ID of the addressed application / SW-C	
	contextld	ID of the addressed context	
Parameters (in)	logChannel Name	Name of the addressed LogChannel	
	addRemove Op	Operation to add/remove the addressed tuple ApplicationId/ ContextId to/from the addressed LogChannel	
Parameters (inout)	None		
Parameters (out)	None		
Return value	Std_Return- Type	E_OK: No error occurred E_NOT_OK: LogChannel assignment failed	
Description	Adds/removes the addressed tuple ApplicationId/ContextId to/from the addressed LogChannel.		
Available via	Dlt.h		

(()

8.3.21 Dlt_SetLogChannelThreshold

[SWS_DIt_00752][

Service Name	Dlt_SetLogChannelThreshold

Specification of Diagnostic Log and Trace AUTOSAR CP R22-11

Syntax	Std_ReturnType Dlt_SetLogChannelThreshold (Dlt_LogChannelNameType logChannelName, Dlt_MessageLogLevelType newThreshold, boolean newTraceStatus)			
Service ID [hex]	0x21			
Sync/Async	Synchronous			
Reentrancy	Reentrant for diffe	Reentrant for different LogChannelNames		
	logChannel Name	Name of the addressed LogChannel		
Parameters (in)	newThreshold	Threshold for LogMessages		
	newTraceStatus	TRUE: enable TraceMessages FALSE: disable Trace Messages		
Parameters (inout)	None			
Parameters (out)	None			
Return value	Std_ReturnType			
Description	Sets the filter threshold for the given LogChannel.			
Available via	Dlt.h			

]()

8.3.22 Dlt_GetLogChannelThreshold

[SWS_DIt_00753][

Service Name	Dlt_GetLogChannelThreshold		
Syntax	Std_ReturnType Dlt_GetLogChannelThreshold (Dlt_LogChannelNameType logChannelName, Dlt_MessageLogLevelType* logChannelThreshold, boolean* traceStatus)		
Service ID [hex]	0x22		
Sync/Async	Synchronous		
Reentrancy	Reentrant for different LogChannelNames		
Parameters (in)	logChannelName Addressed LogChannel name		

Specification of Diagnostic Log and Trace AUTOSAR CP R22-11

Parameters (inout)	None		
Parameters (out)	logChannel Threshold	Current LogChannelThreshold	
	traceStatus	Current TraceStatus. TRUE: TraceMessages enabled. FALSE: TraceMessages disabled.	
Return value	Std_ReturnType		
Description	Returns the filter threshold for the given LogChannel.		
Available via	Dlt.h		

]()

8.3.23 Dlt_SendLogMessageWithAttributes

[SWS_Dlt_91011][

Service Name	Dlt_SendLogI	Dlt_SendLogMessageWithAttributes		
Syntax	<pre>Std_ReturnType Dlt_SendLogMessageWithAttributes (Dlt_SessionIDType sessionId, const Dlt_MessageLogInfoType* logInfo, const uint8* logData, uint16 logDataLength, const Dlt_MessageAttributesType* attributes)</pre>			
Service ID [hex]	0x81			
Sync/Async	Synchronous			
Reentrancy	Reentrant			
	sessionId	For SW-C this is not visible (Port defined argument value), for BSW-modules it is the module number		
	logInfo	Structure containing the relevant information for filtering the message.		
Parameters (in)	logData	Buffer containing the parameters to be logged. The contents of this pointer represents the payload of the Log Message to be sent.		
	logData Length	Length of the data buffer logData.		
	attributes	Structure containing optional message attributes		
Parameters (inout)	None			

Parameters (out)	None	
Return value	Std_Return- Type	DLT_OK: The required operation succeeded. DLT_E_MSG_TOO_LARGE: The message is too large for all assigned LogChannels DLT_E_NO_BUFFER: The LogMessage could not be buffered at any assigned LogChannel DLT_E_UNKNOWN_SESSION_ID: The provided session id is unknown.
Description	The service represents the interface to be used by basic software modules or by software component to send Log Messages with attributes.	
Available via	Dlt.h	

8.3.24 Dlt_SendTraceMessageWithAttributes

[SWS_DIt_91012][

[3V3_DIL_91012]				
Service Name	Dlt_SendTrac	Dlt_SendTraceMessageWithAttributes		
Syntax	<pre>Std_ReturnType Dlt_SendTraceMessageWithAttributes (Dlt_SessionIDType sessionId, const Dlt_MessageTraceInfoType* traceInfo, const uint8* traceData, uint16 traceDataLength, const Dlt_MessageAttributesType* attributes)</pre>			
Service ID [hex]	0x82	0x82		
Sync/Async	Synchronous			
Reentrancy	Reentrant			
	sessionId	For SW-C this is not visible (Port defined argument value), for BSW-modules it is the module number		
	traceInfo	Structure containing the relevant information for filtering the message.		
Parameters (in)	traceData	Buffer containing the parameters to be traced. The contents of this pointer represents the payload of the Trace Message to be sent.		
	traceData Length	Length of the data buffer traceData.		
	attributes	Structure containing optional message attributes		
Parameters (inout)	None			
Parameters	None			

(out)		
Return value	Std_Return- Type	DLT_OK: The required operation succeeded. DLT_E_MSG_TOO_LARGE: The message is too large for all assigned LogChannels DLT_E_NO_BUFFER: The LogMessage could not be buffered at any assigned LogChannel DLT_E_UNKNOWN_SESSION_ID: The provided session id is unknown.
Description	The service represents the interface to be used by basic software modules or by software components to trace parameters, with attributes.	
Available via	Dlt.h	

8.4 Call-back notifications

This is a list of functions provided for other modules. The function prototypes of the callback functions shall be provided in the file $Dlt_Cbk.h$.

8.4.1 Dlt_RxIndication

ISWS DIt 002721[

[O110_DIL_002	W9_DIL_00Z7ZJ		
Service Name	Dlt_RxIr	Dlt_RxIndication	
Syntax	<pre>void Dlt_RxIndication (PduIdType RxPduId, const PduInfoType* PduInfoPtr)</pre>		
Service ID [hex]	0x42	0x42	
Sync/Async	Synchronous		
Reentrancy	Reentrant for different Pdulds. Non reentrant for the same Pduld.		
Parameters	RxPdu Id	ID of the received PDU.	
(in)	Pdu InfoPtr	I butter (Sdul)ataPtr) containing the PDIL and the Metal)ata related to this I	
Parameters (inout)	None		
Parameters (out)	None		
Return value	None		

Description	Indication of a received PDU from a lower layer communication interface module.
Available via	Dlt.h

8.4.2 Dlt_TriggerTransmit

[SWS Dlt 00754][

[3W3_DIL_00/34]			
Service Name	Dlt_TriggerT	Dlt_TriggerTransmit	
Syntax	<pre>Std_ReturnType Dlt_TriggerTransmit (PduIdType TxPduId, PduInfoType* PduInfoPtr)</pre>		
Service ID [hex]	0x41	0x41	
Sync/Async	Synchronou	Synchronous	
Reentrancy	Reentrant for different Pdulds. Non reentrant for the same Pduld.		
Parameters (in)	TxPduld	ID of the SDU that is requested to be transmitted.	
Parameters (inout)	PduInfoPtr	Contains a pointer to a buffer (SduDataPtr) to where the SDU data shall be copied, and the available buffer size in SduLengh. On return, the service will indicate the length of the copied SDU data in SduLength.	
Parameters (out)	None		
Return value	Std Return- Type	E_OK: SDU has been copied and SduLength indicates the number of copied bytes. E_NOT_OK: No SDU data has been copied. PduInfoPtr must not be used since it may contain a NULL pointer or point to invalid data.	
Description	Within this API, the upper layer module (called module) shall check whether the available data fits into the buffer size reported by PduInfoPtr->SduLength. If it fits, it shall copy its data into the buffer provided by PduInfoPtr->SduDataPtr and update the length of the actual copied data in PduInfoPtr->SduLength. If not, it returns E_NOT_OK without changing PduInfoPtr.		
Available via	Dlt.h		

]()

[SWS_DIt_00755] [If development error detection is enabled for this module, the module shall check all parameters for being valid. If the check fails, the function shall raise a development error and return. | ()

8.4.3 Dlt_TxConfirmation

[SWS_Dlt_00273][

Service Name		Dlt_TxConfirmation	
Syntax	<pre>void Dlt_TxConfirmation (PduIdType TxPduId, Std_ReturnType result)</pre>		
Service ID [hex]	0x40		
Sync/Async	Synchronous		
Reentrancy	Reentrant for different Pdulds. Non reentrant for the same Pduld.		
	TxPduld	ID of the PDU that has been transmitted.	
Parameters (in)	result	E_OK: The PDU was transmitted. E_NOT_OK: Transmission of the PDU failed.	
Parameters (inout)	None		
Parameters (out)	None		
Return value	None		
Description	The lower layer communication interface module confirms the transmission of a PDU, or the failure to transmit a PDU.		
Available via	Dlt.h		

]()

8.4.4 Dlt_TpTxConfirmation

[SWS_DIt_00756][

Service Name	Dlt_TpTxConfirmation		
Syntax	<pre>void Dlt_TpTxConfirmation (PduIdType id, Std_ReturnType result)</pre>		
Service ID	0x48		

[hex]			
Sync/Async	Synchronous		
Reentrancy	Reentrant		
Parameters	id	Identification of the transmitted I-PDU.	
(in)	result	E_OK: The PDU was transmitted. E_NOT_OK: Transmission of the PDU failed.	
Parameters (inout)	None		
Parameters (out)	None		
Return value	None		
Description	This function is called after the I-PDU has been transmitted on its network, the result indicates whether the transmission was successful or not.		
Available via	Dlt.h		

8.4.5 Dlt_CopyTxData

[SWS_DIt_00516][

[SVVS_DIT_U	00316]			
Service Name	Dlt_CopyTx	Dlt_CopyTxData		
Syntax	<pre>BufReq_ReturnType Dlt_CopyTxData (PduIdType id, const PduInfoType* info, const RetryInfoType* retry, PduLengthType* availableDataPtr)</pre>			
Service ID [hex]	0x43	0x43		
Sync/Async	Synchronous			
Reentrancy	Reentrant			
	id	id Identification of the transmitted I-PDU.		
Parameters (in)	info	Provides the destination buffer (SduDataPtr) and the number of bytes to be copied (SduLength). If not enough transmit data is available, no data is copied by the upper layer module and BUFREQ_E_BUSY is returned. The lower layer module may retry the call. An SduLength of 0 can be used to indicate state changes in the retry parameter or to query the current amount of available data in the upper layer module. In this case, the SduDataPtr may be a NULL_PTR.		

	retry	This parameter is used to acknowledge transmitted data or to retransmit data after transmission problems. If the retry parameter is a NULL_PTR, it indicates that the transmit data can be removed from the buffer immediately after it has been copied. Otherwise, the retry parameter must point to a valid RetryInfoType element. If TpDataState indicates TP_CONFPENDING, the previously copied data must remain in the TP buffer to be available for error recovery. TP_DATACONF indicates that all data that has been copied before this call is confirmed and can be removed from the TP buffer. Data copied by this API call is excluded and will be confirmed later. TP_DATARETRY indicates that this API call shall copy previously copied data in order to recover from an error. In this case TxTpDataCnt specifies the offset in bytes from the current data copy position.
Parameters (inout)	None	
Parameters (out)	available DataPtr	Indicates the remaining number of bytes that are available in the upper layer module's Tx buffer. availableDataPtr can be used by TP modules that support dynamic payload lengths (e.g. FrIsoTp) to determine the size of the following CFs.
Return value	BufReq Return- Type	BUFREQ_OK: Data has been copied to the transmit buffer completely as requested. BUFREQ_E_BUSY: Request could not be fulfilled, because the required amount of Tx data is not available. The lower layer module may retry this call later on. No data has been copied. BUFREQ_E_NOT_OK: Data has not been copied. Request failed.
Description	Each call to DataState is beginning a	n is called to acquire the transmit data of an I-PDU segment (N-PDU). It this function provides the next part of the I-PDU data unless retry->Tp is TP_DATARETRY. In this case the function restarts to copy the data at the offset from the current position indicated by retry->TxTpDataCnt. the remaining data is written to the position indicated by availableDataPtr.
Available via	Dlt.h	

J(RS_LT_00034)

8.4.6 Dlt_StartOfReception

[SWS_DIt_91006][

Service Name	Dlt_StartOfReception		
Syntax	<pre>BufReq_ReturnType Dlt_StartOfReception (PduIdType id, const PduInfoType* info, PduLengthType TpSduLength, PduLengthType* bufferSizePtr)</pre>		
Service ID	0x46		

[hex]			
Sync/Async	Synchronous		
Reentrancy	Reentrant		
	id	Identification of the I-PDU.	
Parameters (in)	info	Pointer to a PduInfoType structure containing the payload data (without protocol information) and payload length of the first frame or single frame of a transport protocol I-PDU reception, and the MetaData related to this PDU. If neither first/single frame data nor MetaData are available, this parameter is set to NULL_PTR.	
	TpSdu Length	Total length of the N-SDU to be received.	
Parameters (inout)	None		
Parameters (out)	buffer SizePtr	Available receive buffer in the receiving module. This parameter will be used to compute the Block Size (BS) in the transport protocol module.	
Return value	BufReq Return- Type	BUFREQ_OK: Connection has been accepted. bufferSizePtr indicates the available receive buffer; reception is continued. If no buffer of the requested size is available, a receive buffer size of 0 shall be indicated by bufferSizePtr. BUFREQ_E_NOT_OK: Connection has been rejected; reception is aborted. bufferSizePtr remains unchanged. BUFREQ_E_OVFL: No buffer of the required length can be provided; reception is aborted. bufferSizePtr remains unchanged.	
Description	This function is called at the start of receiving an N-SDU. The N-SDU might be fragmented into multiple N-PDUs (FF with one or more following CFs) or might consist of a single N-PDU (SF). The service shall provide the currently available maximum buffer size when invoked with TpSduLength equal to 0.		
Available via	Dlt.h	Dlt.h	

8.4.7 Dlt_TpRxIndication

[SWS_DIt_91007][

Service Name	Dlt_TpRxIndication	
Syntax	<pre>void Dlt_TpRxIndication (PduIdType id, Std_ReturnType result)</pre>	
Service ID [hex]	0x45	
Sync/Async	nc/Async Synchronous	

Reentrancy	Reentrant	
Parameters (in)	id	Identification of the received I-PDU.
	result	E_OK: The PDU was received. E_NOT_OK: Reception of the PDU failed.
Parameters (inout)	None	
Parameters (out)	None	
Return value	None	
Description	Called after an I-PDU has been received via the TP API, the result indicates whether the transmission was successful or not.	
Available via	Dlt.h	

8.4.8 Dlt_CopyRxData

ISWS DIt 910081[

[3442_DIC_9 1000]					
Service Name	Dlt_CopyRxData				
Syntax	<pre>BufReq_ReturnType Dlt_CopyRxData (PduIdType id, const PduInfoType* info, PduLengthType* bufferSizePtr)</pre>				
Service ID [hex]	0x44	0x44			
Sync/Async	Synchronous				
Reentrancy	Reentrant				
	id	id Identification of the received I-PDU.			
Parameters (in)	info	Provides the source buffer (SduDataPtr) and the number of bytes to be copied (SduLength). An SduLength of 0 can be used to query the current amount of available buffer in the upper layer module. In this case, the SduDataPtr may be a NULL_PTR.			
Parameters (inout)	None				
Parameters (out)	bufferSize Ptr Available receive buffer after data has been copied.				
Return value	BufReq	BufReq BUFREQ_OK: Data copied successfully			

Specification of Diagnostic Log and Trace AUTOSAR CP R22-11

	Return- Type	BUFREQ_E_NOT_OK: Data was not copied because an error occurred.
Description	the upper la	n is called to provide the received data of an I-PDU segment (N-PDU) to ayer. Each call to this function provides the next part of the I-PDU data. the remaining buffer is written to the position indicated by bufferSizePtr.
Available via	Dlt.h

Service ID [hex]	0x80
Description	
Available via	SchM_Dlt.h

]()

[SWS_Dlt_00758] [If the configuration parameter

DltGeneralTrafficShapingSupport is set to TRUE, the Dlt messages shall be transmitted with the maximum bandwidth per LogChannel as configured using the parameter DltLogChannelTrafficShapingBandwidth. | ()

[SWS Dlt 00759] [If the configuration parameter

DltGeneralTrafficShapingSupport is set to FALSE, all buffered Dlt messages shall be transmitted at once. | ()

[SWS_DIt_00760] [The Dlt_TxFunction shall check the status of the flag, which indicates that a BufferOverflow occurred:

- If a buffer overflow occurred, the DIt command "BufferOverflowNotification" shall be sent only once, until the overflow flag is cleared again.
- After a time interval given by the parameter
 DltLogChannelBufferOverflowTimer, the buffer overflow flag shall be
 cleared.

This shall be done for every configured LogChannel separately. | ()

[SWS_DIt_00761] [If a DIt message could not be sent, every time the Dlt_TxFunction is called, it shall retry to send this message one time. This shall be done for every message separately and taking care to not exceed the amount of retries given by DltLogChannelMaxNumOfRetries. | ()

8.6 Expected interfaces

In this section all external interfaces required from other modules are listed.

8.6.1 Mandatory interfaces

This section defines all external interfaces which are required to fulfill the core functionality of the module.

The module relies on the following interfaces:

[SWS_DIt_00762][

API Function	Header File	Description
PduR_DltTransmit	PduR_Dlt.h	Requests transmission of a PDU.

]()

8.6.2 Optional interfaces

This section defines all external interfaces which are required to fulfill an optional functionality of the module.

The module relies on the following optional interfaces:

[SWS_Dlt_00763][

API Function	Header File	Description	
Det_ReportError	Det.h	Service to report development errors.	
Gpt_Enable- Notification	Gpt.h	Enables the interrupt notification for a channel (relevant in normal mode).	
Gpt_StartTimer	Gpt.h	Starts a timer channel.	
NvM_EraseNvBlock	NvM.h	Service to erase a NV block.	
NvM_ReadBlock	NvM.h	Service to copy the data of the NV block to its corresponding RAM block.	
NvM_WriteBlock	NvM.h	Service to copy the data of the RAM block to its corresponding NV block.	
StbM_GetCurrent- Time	StbM.h	Returns a time value (Local Time Base derived from Global Time Base) in standard format. Note: This API shall be called with locked interrupts / within an Exclusive Area to prevent interruption (i.e., the risk that the time stamp is outdated on return of the function call).	
StbM_GetCurrent- TimeExtended (obsolete)	StbM.h	Returns a time value (Local Time Base derived from Global Time Base) in extended format. Note: This API shall be called with locked interrupts / within an Exclusive Area to prevent interruption (i.e., the risk that the time stamp is outdated on return of the function call). Tags: atp.Status=obsolete	

]()

8.6.3 Configurable interfaces

This section defines all configurable external interfaces.

[SWS_DIt_00259][

Service Name	Dlt_InjectCall_ <session></session>
Syntax	<pre>void Dlt_InjectCall_<session> (Dlt_ApplicationIDType appId, Dlt_ContextIDType contextId, uint32 serviceId,</session></pre>

Specification of Diagnostic Log and Trace AUTOSAR CP R22-11

	<pre>uint32 dataLength, const uint8* data)</pre>		
Sync/Async	Asynchronous		
Reentrancy	Non Reentrant		
Parameters (in)	appld	the Application ID	
	contextId	the Context ID	
	serviceId	the service ID for the injection (user defined)	
	dataLength	length of the data puffer provided	
	data	pointer to data puffer with data belonging to the injection (service ID). The contents of the data is user defined	
Parameters (inout)	None		
Parameters (out)	None		
Return value	None		
Description	Callback is called by Dlt to inject a function call in the SW-C. The behaviour trigged by this function should depend on the service_id also the interpretation of the user data. Both are specific to the application.		
Available via	Dlt.h

10 Configuration specification

Chapter 10.1 specifies the structure (containers) and the parameters of the module Dlt.

Chapter 10.2 specifies additionally published information of the module Dlt.

10.1 Containers and configuration parameters

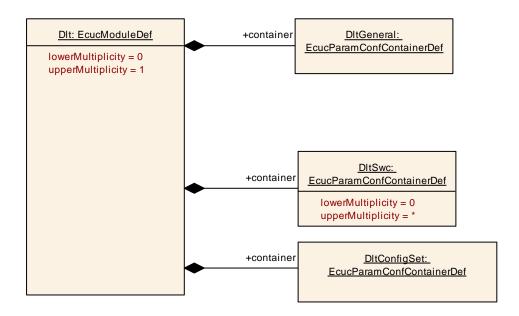

The following chapters summarize all configuration parameters. The detailed meanings of the parameters describe chapters 0 and chapter 8.

10.1.1 DIt

SWS Item		[ECUC_Dlt_00800]		
Module Name		Dit		
Description				
Post-Build Support	Variant	true		
Supported Variants	Config	VARIANT-LINK-TIME, COMPILE	VARIANT-POST-BUILD,	VARIANT-PRE-

Included Containers			
Container Name	Multiplicity	Scope / Dependency	
DltConfigSet	1	This container lists all the global Dlt functionalities that can be enabled or disabled at pre-compile time to optimize resource consumption.	
DitGeneral	1	This container lists all the global Dlt functionalities that can be enabled or disabled at pre-compile time to optimize resource consumption.	
DltSwc	0*	Contains necessary configuration parameters of the AUTOSAR DIt module to interact with SWCs.	

10.1.2 DItGeneral

SWS Item	[ECUC_DIt_00809]	
Container Name	DitGeneral	
Parent Container	Dit	
Description	This container lists all the global Dlt functionalities that can be enabled or disabled at pre-compile time to optimize resource consumption.	
Configuration Parameters		

SWS Item	[ECUC_Dlt_00840]			
Parameter Name	DltGeneralDevErrorDetect			
Parent Container	DltGeneral			
Description	If the Default Error Tracer (Det) shall be used, this parameter shall be set to TRUE. Otherwise, it shall be set to FALSE.			
Multiplicity	1			
Туре	EcucBooleanParamDef			
Default value				
Post-Build Variant Value	false			
	Pre-compile time	Х	All Variants	
Value Configuration Class	Link time			
	Post-build time			
Scope / Dependency	scope: local			

SWS Item	[ECUC_Dlt_00847]		
Parameter Name	DltGeneralInjectionSupport		
Parent Container	DltGeneral		
Description	Enables or disables the Dlt Injection feature.		
Multiplicity	1		
Туре	EcucBooleanParamDef		
Default value	false		
Post-Build Variant Value	false		
Value Configuration Class	Pre-compile time	Х	All Variants

	Link time	
	Post-build time	
Scope / Dependency	scope: local	

SWS Item	[ECUC_Dlt_00915]		
Parameter Name	DltGeneralNvRAMSupport		
Parent Container	DltGeneral		
Description	Enables or disables the Dlt NvRAM	1 Supp	ort feature.
Multiplicity	1		
Туре	EcucBooleanParamDef		
Default value	false		
Post-Build Variant Value	false		
	Pre-compile time X All Variants		All Variants
Value Configuration Class	Link time		
	Post-build time		
Scope / Dependency	scope: local		

SWS Item	[ECUC_Dlt_00846]			
Parameter Name	DltGeneralRegisterContextNotification			
Parent Container	DltGeneral			
Description	If this parameter is set to TRUE, a Dlt Control Message is sent every time a SWC registeres and/or de-registers at/from the Dlt Module. Else, this notification is not sent.			
Multiplicity	1			
Туре	EcucBooleanParamDef	EcucBooleanParamDef

	Post-build time		
Scope / Dependency	Scope / Dependency scope: local		

SWS Item	[ECUC_DIt_00905]				
Parameter Name	DltGeneralGptChannelRef				
Parent Container	DltGeneral				
Description	If TimeStampSupport is used the Dlt module shall fetch the time from the Gpt module by calling Gpt_GetTimeElapsed with the here referenced GptChannel. The tick duration can be deduced from the GptChannelTickFrequency parameter of the GptChannelConfiguration container. This is necessary to calculate the microsecond resolution timestamp output in the Dlt message. A GPT timer shall be used which starts with value 0 at ECU start-up according to the PRS Dlt Protocol Specification.				
Multiplicity	01				
Туре	Symbolic name reference to GptChannel	Symbolic name reference to GptChannelConfiguration			
Post-Build Variant Multiplicity	false				
Post-Build Variant Value	false

Included Containers					
Container Name	Multiplicity	Scope / Dependency			
DltTxPdu	1	Contains the configuration parameters of the AUTOSAR DIt module's Tx Pdus.			

10.1.17 DltTxPdu

SWS Item	[ECUC_Dlt_00907]
----------	------------------

Container Name	DltTxPdu	
Parent Container	DltLogChannel	
Description	Contains the configuration parameters of the AUTOSAR Dlt module's Tx Pdus.	
Configuration Parameters		

SWS Item	[ECUC_Dlt_00893]				
Parameter Name	DltTxPduld				
Parent Container	DltTxPdu				
Description	The numerical value used as the ID of this I-PDU. This handle Id is used for the APIs calls Dlt_TxConfirmation, Dlt_TriggerTransmit, Dlt_TriggerIPDUSend or Dlt_TriggerIPDUSendWithMetaData, Dlt_CopyTxData and Dlt_TpTx Confirmation to transmit respectively confirm transmissions of I-PDUs.				
Multiplicity	01				
Туре	EcucIntegerParamDef (Symbol	lic Nam	ne generated for this parameter)		
Range	0 65535				
Default value					
Post-Build Variant Multiplicity	true				
Post-Build Variant Value	true				
Multiplicity	Pre-compile time X VARIANT-PRE-COMPILE				
Configuration Class	Link time	Link time X VARIANT-LINK-TIME			
Class	Post-build time X VARIANT-POST-BUILD				
Value	Pre-compile time X VARIANT-PRE-COMPILE				
Configuration Class	Link time	Х	VARIANT-LINK-TIME		
Post-build time X VARIANT-POST-BUILD					
Scope / Dependency	scope: ECU				

SWS Item	[ECUC_DIt_00913]
Parameter Name	DltTxPduUsesTp
Parent Container	DltTxPdu
Description	If set to TRUE, the PDU is transmitted using the TP API. If FALSE, the IF API is used.

Multiplicity	1			
Туре	EcucBooleanParamDef			
Default value				
Post-Build Variant Value	true			
	Pre-compile time	Х	VARIANT-PRE-COMPILE	
Value Configuration Class	Link time	Х	VARIANT-LINK-TIME	
	Post-build time	Х	VARIANT-POST-BUILD	
Scope / Dependency scope: local				

SWS Item	[ECUC_DIt_00892]			
Parameter Name	DltTxPduRef			
Parent Container	DltTxPdu			
Description	Reference to the "global" Pdu structure to allow harmonization of handle IDs in the COM-Stack.			
Multiplicity	1			
Туре	Reference to Pdu			
Post-Build Variant Value	true			
	Pre-compile time X VARIANT-PRE-COMPILE			
Value Configuration Class	Link time	Х	VARIANT-LINK-TIME	
	Post-build time	Х	VARIANT-POST-BUILD	
Scope / Dependency	scope: local			

No Included Containers

10.1.18 DltRxPdu

SWS Item	[ECUC_Dlt_00900]		
Container Name	DltRxPdu		
Parent Container	DltConfigSet		
Description	Contains the Pdu IDs to be used for Dlt control messages reception.		

Post-Build Variant Multipli	true true	true		
	Pre-compile	time X	VARIANT-PRE-COMPILE	
Multiplicity Configuration Class	Link time	X	VARIANT-LINK-TIME	
	Post-build tir	ne X	VARIANT-POST-BUILD	
Configuration Parameters				

SWS Item	[ECUC_DIt_00899]			
Parameter Name	DltRxPduld			
Parent Container	DltRxPdu			
Description	The numerical value used as the ID of this I-PDU. The DltRxPduId is required by the API calls Dlt_RxIndication, Dlt_TpRxIndication, Dlt_StartOfReception and Dlt_CopyRxData to receive I-PDUs from the PduR.			
Multiplicity	01			
Туре	EcucIntegerParamDef (Symbo	olic Nar	me generated for this parameter)	
Range	0 65535			
Default value				
Post-Build Variant Multiplicity	true			
Post-Build Variant Value	true			
Multiplicity	Pre-compile time X VARIANT-PRE-COMPILE			
Configuration Class	Link time	Х	VARIANT-LINK-TIME	
Class	Post-build time X VARIANT-POST-BUILD			
Value	Pre-compile time	Х	VARIANT-PRE-COMPILE	
Configuration Class	Link time	Х	VARIANT-LINK-TIME	
Ciass	Post-build time	Х	VARIANT-POST-BUILD	
Scope / Dependency	scope: ECU			

SWS Item	[ECUC_Dlt_00912]
Parameter Name	DltRxPduUsesTp
Parent Container	DltRxPdu
Description	If set to TRUE, the PDU is received using the TP API. If FALSE, the IF API is used.
Multiplicity	1

Туре	EcucBooleanParamDef			
Default value				
Post-Build Variant Value	true			
	Pre-compile time	Х	VARIANT-PRE-COMPILE	
Value Configuration Class	Link time	Х	VARIANT-LINK-TIME	
	Post-build time	Х	VARIANT-POST-BUILD	
Scope / Dependency	scope: local			

SWS Item	[ECUC_Dlt_00898]			
Parameter Name	DltRxPduRef			
Parent Container	DltRxPdu			
Description	Reference to the "global" Pdu structure to allow harmonization of handle IDs in the COM-Stack.			
Multiplicity	1			
Туре	Reference to Pdu			
Post-Build Variant Value	true			
	Pre-compile time X VARIANT-PRE-COMPILE			
Value Configuration Class	Link time	Х	VARIANT-LINK-TIME	
	Post-build time	Х	VARIANT-POST-BUILD	
Scope / Dependency	scope: local			

No Included Containers

10.2 Published Information

Published information contains data defined by the implementer of the SW module that does not change when the module is adapted (i.e. configured) to the actual HW/SW environment. It thus contains version and manufacturer information.

Additional module-specific published parameters are listed below if applicable.
